Cottier tenure or system, a tenure of land by which a laborer rents a portion of land directly from the owner, and the conditions of the contract, especially the amount of rent to be paid, are determined not by custom, but by competition. This system was at one time especially characteristic of Ireland, and is not yet entirely extinct there. The tenancy was annual, and the privilege of occupancy was put up at auction, the consequence being excessive competition and exorbitant rents, since the cotter was obliged to get the land at any price in order to live. In an act passed in 1860 to consolidate and amend the law of landlord and tenant in Ireland, cottier tenancies are defined to be cottages with not more than half an acre of land, rented by the month at not more than £5 a year.

Thus understood, it embraced all the mail-cheeked fishes, and answered to the "joues cuirassées" of Cuvier. In this sense it embraces not only the true *Cottidæ*, but also the *Platycephalidæ*, *Hoplichthyidæ*, *Triglidæ*, and *Rhamphocottidæ* of other authors. (*c*) In Gill's system, a family of *Cottoidea* with a well-developed myodome, uninterrupted cranial valleys behind, and the spinous part of the dorsal shorter than the soft part. The spinous part of the dorsal fin is less developed than the soft part, or than the anal; the body is naked, or covered with ordinary scales, or incompletely cuirassed with a single series of plate-like scales; and the pyloric appendages are four in number. It was later raised by Günther to the rank of a family. See *Cottidæ*.

Gael. *cotan* = W. *cotwm*, cotton, from E.] **I.** *n.* **1.** The white fibrous substance clothing the seeds of the cotton-plant (*Gossypium*). See cut under *cotton-plant*. It consists of simple delicate tubular hair-like cells, flattened and somewhat twisted. Its commercial value depends upon the length and tenacity of the fiber. It is the clothing material of a large proportion of the human race, its use dating back to a very early period. In commercial importance cotton exceeds all other staples. The United States ranks first in the consumption of the raw material, the United Kingdom being second, and then Germany. Cotton consists of nearly pure cellulose, and when acted upon by nitric acid yields a nitro-compound known as guncotton, which is a powerful explosive, and when dissolved in ether and alcohol forms collodion. Cotton is very extensively used in the manufacture of thread, and for many purposes in the arts. In surgery it is employed for many purposes, and especially as a dressing for burns, scalds, etc. See *cotton-plant*, *Gossypium*.

2. Cloth made of cotton. It was originally obtained in Europe from India, always famous for the excellence and fineness of its cotton fabrics, as in the Dacca muslins, and has long been in use throughout the East. In 1700 the importation into England of printed cotton cloth was prohibited, and in 1721 fines were imposed upon the venders and wearers of cotton, because it was thought to interfere with the home manufacture of woolens and silks. Modern inventions facilitating its manufacture by machinery have built up an immense industry in Europe and the United States. See *cotton-gin*, *spinning-jenny*.

In this the fiber rests upon or against a grid, into the openings of which project the teeth of a gang of saws mounted upon a revolving mandrel. The teeth of the saws catch the fibers and draw them away from the seeds. The latter, being too large to pass through the openings, roll downward and out of the machine. The fibers, removed from the saws by a revolving brush, pass between rollers, and are delivered from the machine in the form of a lap. Other and similar machines have projecting needles, or hooked or covered wire teeth, instead of saws. See *roller-gin.*

★**cotton-plant** (kot′n-plant), *n.* The popular name of several species of *Gossypium,* family *Malvaceæ,* from which the well-known textile substance cotton is obtained. The genus is indigenous to both hemispheres, and the plants are now cultivated all over the world within the limits of 36° north and south of the equator. All the species are perennial and become somewhat shrubby, but in cultivation they are usually treated as annuals. They have alternate stalked and lobed leaves, large yellow flowers, becoming reddish on the second day, and a three- or five-celled capsule, which bursts open when ripe through the middle of the cells, liberating the numerous black seeds covered with the beautiful filamentous cotton. The species yielding the cotton of commerce are: *G. Barbadense,* known as sea-island cotton, with a fine, soft, silky staple nearly two inches long; *G. herbaceum,* yielding the upland or short-staple cotton of the United States; and *G. arboreum.* Many varieties of these species are known. The kidney, Peruvian, Brazil, and Bahia cottons of commerce are all produced by varieties of *G. Barbadense.* Nankin cotton is a naturally colored variety. Cotton-seed, after the removal of the fiber, yields upon pressure a large amount of yellow oil, with a bland, nut-like taste, closely resembling olive-oil, as a substitute or adulterant for which it is largely used. The residue after the extraction of the oil, called *cotton-cake,* is valuable as food for cattle and as a manure. 7. In *eccles. hist.*: (*a*) An assembly of prelates and theologians convened for the purpose of regulating matters of doctrine and discipline in the church. Ecclesiastical councils are *diocesan, provincial, national, general,* or *ecumenical.* A diocesan council is composed of the ecclesiastics of a particular diocese, with the bishop at their head; a provincial or metropolitan council, of the bishops of an ecclesiastical province, with the archbishops at their head; and a national or plenary council, of the bishops and archbishops of all the provinces in the nation. *General council* and *ecumenical council* are ordinarily regarded as equivalent terms, but strictly speaking a general council is one called together by an invitation addressed to the church at large, and claiming to speak in the name of the whole church. Such a council is ecumenical only if received by the Catholic Church in general. None of the general councils most widely accepted as ecumenical consisted of even a majority of orthodox bishops present in person or by deputy. The subsequent consent of the church at large, according to the Gallican view, marked them as ecumenical, especially their reception by the next general council and when the first violence of controversy had somewhat abated. Both emperors and popes have summoned general councils. According to Roman Catholic teaching, a council to be regarded as ecumenical must have been called together by the pope, or at least with his consent, and its decrees must be confirmed by the pope. There are seven ecumenical councils recognized as such by both the Greek and Latin or Roman Catholic churches, and to some extent also by some Protestant theologians: they are the first Council of Nice, held in 325; the first Council of Constantinople, 381; the Council of Ephesus, 431; the Council of Chalcedon, 451; the second Council of Constantinople, 553; the third Council of Constantinople, 680; and the second Council of Nice, 787. Other important councils regarded by the Roman Catholic, but not by either the Greek or the Protestant communion, as ecumenical are the Council of Trent (1545–63) and the Council of the Vatican (1869–70). The Anglican Church receives the first six councils. (*b*) An advisory assembly of clerical or clerical and lay members in certain Reformed denominations.—**8.** Any body or group of persons wielding political power.

count[2] (kount), *n.* [Not in ME. except in fem. form *countess*, q. v.; < OF. *conte, comte*, F. *comte* = Pr. *coms* = Sp. Pg. *conde* = It. *conte*, < L. *comes* (*comit-*), a companion, later a title of office or honor (cf. *constable*), < *com-*, together, + *ire*, supine *itum*, go, = Gr. *ἰέναι*, go: see *go*.] A title of nobility in France, Italy, Spain, and Portugal (corresponding to *earl* in Great Britain and *graf* in Germany), whence the name *county*, originally applied to the demain appertaining to the holder of such a title. Under the Roman republic a count was a companion or an assistant of a proconsul or propretor in his foreign government; under the empire, an officer of the imperial household, or an attendant upon the emperor in his official duties, the title being ultimately extended to officers of various grades in different parts of the empire. Among early Teutonic races the count or graf was the officer set by a sovereign over a district or gau, charged with the preservation of the king's authority. In France, under Charles the Bald, a system of government by counts as personal agents of the sovereign was developed. Later, with the growth of the feudal system, they became the feudal proprietors of lands and territories, and thus not merely royal officers, but nobles, and, as such, hereditary rulers. At the present time the title, inherited alike by all the sons of a count or conferred by the sovereign, serves merely to indicate nobility. As a title, *count* does not occur in the nomenclature of the English nobility, except as in *count palatine*; but the feminine form *countess* is the recognized feminine equivalent of *earl*.

The prince, the *count*, . . . and all the gallants of the town, are come. *Shak.*, Much Ado, iii. 4.

Shire is a Saxon word signifying a division; but a county, comitatus, is plainly derived from comes, the *count* of the Franks, that is, the earl or alderman (as the Saxons called him) of the shire. *Blackstone*, Com., Int., § 4.

Count palatine. (*a*) Originally, the judge and highest officer of the German kings, afterward of the German emperors and archdukes; at a later date, an officer delegated by the German emperors to exercise certain imperial privileges. (*b*) Formerly, in England, the proprietor of a county, who exercised regal prerogatives within his county, in virtue of which he had his own courts of law, appointed judges and law officers, and could pardon murders, treasons, and felonies. All writs and judicial processes proceeded in his name, while the king's writs were of no avail within the palatinate. The Earl of Chester, the Bishop of Durham, and the Duke of Lancaster were the counts palatine of England. The king is now Duke and Count Palatine of Lancaster. The earldom palatinate of Chester, similarly restricted, is vested

in the eldest son of the monarch, or in the monarch himself when there is no Prince of Wales. Durham became a palatinate in the time of William the Conqueror, and the dignity continued in connection with the bishopric till 1836, when it was vested in the crown. See *palatine*, and *county palatine*, under *county*.

3. In *music*: (*a*) The art of musical composition in general. (*b*) The art of polyphonic or concerted composition, in distinction from homophonic or melodic composition. (*c*) Specifically, the art of adding to a given melody, subject, theme, or canto fermo, one or more melodies whose relations to the given melody are fixed by rules. Strict or plain counterpoint, which began to be cultivated in the thirteenth century, and attained great extension and perfection in the fifteenth, is usually divided into several species: (1) *note against note*, in which to each note of the cantus is added one note in the accompanying part or parts; (2) *two against one*, in which to each note of the cantus two notes are added; (3) *four against one*, in which four notes are added; (4) *syncopated*, in which to each note of the cantus one note is added after a constant rhythmic interval; (5) *florid* or *figured*, in which the added part or parts are variously constructed. The melodic and harmonic intervals permitted in each species are minutely fixed by rule. Counterpoint is *two-part* when two voices or parts are used, *three-part* when three are used, etc. It is *single* when the added part uniformly lies above or below the cantus; *double* when the added part is so constructed as to be usable both above and below the cantus by a uniform transposition of an octave, a tenth, or some other interval; and *triple* when three melodies are so fitted as to be mutually usable above and below one another by transposition. Among the forms of counterpoint, the canon and the fugue are the most important. (See these words.) Next to a pure and natural use of melodic intervals, various kinds of imitation between the voices are specially sought, such as augmentation, diminution, inversion, reversion, etc. (See these words.) The practice of counterpoint was specially prominent in the Gallo-Belgic school of musicians from the thirteenth to the sixteenth century, and it has been a part of musical training and accomplishment ever since. It is a necessary basis for all polyphonic composition, although in modern music the strictness of its early rules has been much relaxed. (*b*) Now, a definite division of a country or state for political or administrative purposes. In the United States the county is the political unit next below the State (except in Louisiana, which has an analogous division into parishes). Each county has, generally speaking, one or more courts, a sheriff, treasurer, clerk, and various officials engaged in the administration of justice, etc. The number of counties varies greatly in the different States. England has 41 counties (the greater number of which are also called *shires*), Wales 12, Scotland 33, and Ireland 32. For administrative purposes several of the historical counties of England are divided, and the county of London is added, bringing the total for England up to 60. Each of these has a lord lieutenant, a high sheriff, and other officials. By royal favor 12 British cities and towns are counties in themselves, or counties corporate, and under the Local Government Act (1888) 72, having more than 50,000 population, are county boroughs with local officers.

In this respect there are three classes of States: those in which the town is the political unit — the six States of New England; the second, those in which the *county* is the unit — the States of the South; the third, those of the "compromise system," as it has been called — a mixed organization of *county* and township, prevailing in the Middle States and the West.
Austin Scott, Johns Hopkins Univ. Studies, III.

2. Collectively, the inhabitants of a county. — **County corporate**, in England and Ireland, a city or town possessing the privilege of being governed by its own sheriffs and other magistrates, irrespective of the county or counties in which it is situated, as Bristol, Newcastle, Dublin, etc. — **County palatine**, in England, formerly, a county distinguished by particular privileges: so called because the owner or holder had royal powers, or the same powers in the administration of justice as the king had in his palace (see *palatine*); but all such powers are now vested in the crown. The counties palatine in England are Lancaster, Chester, and Durham, which were no doubt made separate regalities on account of their respective proximity to Wales and to that turbulent Northumbrian province which could be accounted a portion neither of England nor of Scotland.

II. *a.* Of or pertaining to a county: as, *county* families; *county* society. — **Board of county commissioners**, an elective board to which, in most counties in the United States, the administration of many important affairs of the county is intrusted. The duties of the board vary in different localities. — **County clerk.** See *clerk*. — **County court**, a court having jurisdiction for a county, usually over actions for a limited amount, and often having some administrative powers, established to facilitate minor litigation. In early English history the county court was a local parliament, containing, in its full session, the archbishops, bishops, abbots, priors, earls, barons, knights, and freeholders, with representatives from each township and each borough. It sat once a month, but these monthly sessions were attended by none but those who had special business, and by the officers of the townships with their qualified jurymen. The existing county courts of England were established under a statute of 1846, each comprising a defined circuit, and sitting usually once a month in each of certain divisions called *county-court districts*. They have jurisdiction for the recovery of small debts, and also certain powers in equity and bankruptcy, and sometimes in admiralty. In the United States each county has a county court for local jurisdiction. In some of the States it is formed by associating all the justices of the peace of the county, and is charged with the administration of county police. See *police*. — **County rates**, in Great Britain and Ireland, rates which are levied upon the county, and collected by the boards of guardians, for the purpose of defraying the expenses to which counties are liable, as repairing bridges, jails, houses of correction, etc. — **County sessions**, in England, the general quarter sessions of the peace for each county, held four times a year. — **County town**, the chief town of a county; a county-seat.

Coup d'archet (kö där-shā'), in *music*, a stroke of a bow. — **Coup de fouet** (kö dē fö-ā'), in *fencing*, the act of lashing the adversary's extended blade by a firm dry beat or jerk, in order to disarm him. *Rolando* (ed. Forsyth). — **Coup de grâce** (kö dē gräs) (literally, a stroke of mercy), the finishing stroke, as in despatching a condemned man with a single blow, or an animal that is mortally wounded, to put it out of its misery; hence, a quietus; anything that thoroughly defeats or silences an opponent. — **Coup de main** (kö dē mañ) (literally, a stroke with the hand), in war, a sudden attack by main force; hence, any sudden, energetic action intended to effect a purpose by surprise. — **Coup de soleil** (kö dē sō-lāy'), a sunstroke. — **Coup d'état** (kö dā-tä') (literally, a stroke of state), a sudden decisive measure in politics; a stroke of policy; specifically, an important and usually unlooked-for change in the forms and methods of government, by the ruling power or by a party, effected illegally or by forced interpretation of law, or by violence or intrigue, for the benefit of an individual or a cabal. The principal *coups d'état* in French history, distinctively so called, are that of November 9th, 1799 (18th Brumaire, year VIII., in the republican calendar), when Napoleon Bonaparte forcibly suppressed the Directory, and that of December 2d, 1851, when Louis Napoleon as president broke up the National Assembly by force of arms and made himself temporarily dictator, preparatory to becoming emperor as Napoleon III. a year later.

The news of the *coup d'état* took England by surprise. A shock went through the whole country. Never probably was public opinion more unanimous, for the hour at least, than in condemnation of the stroke of policy ventured on by Louis Napoleon, and the savage manner in which it was carried to success. *J. McCarthy*, Hist. Own Times, xxii.

Coup de théâtre (kö dē tā-ä'tr), a theatrical hit; a brilliant or exciting turn or trick in a play; hence, any sudden and showy action having the effect of exciting surprise or admiration by means more or less sensational. — **Coup d'œil** (kö dēy). (*a*) A glance of the eye; general view.

Singularly enough, the taking of a scalp does not *count a coup*, neither does the killing of an enemy. To *count a coup*, the person must take a bow or weapon or the horse of an enemy, and must have witnesses present to prove it. He must also bring with him the arms by which he *counts* his *coups*. *Forest and Stream.*

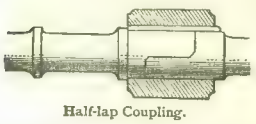
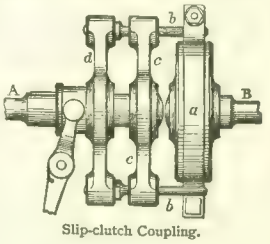
Even to the artificers and builders gave they it, to buy hewn stone, and timber for *couplings*. 2 Chron. xxxiv. 11.

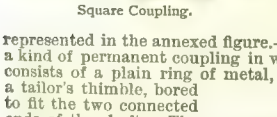


Specifically—(*a*) In *music*: (1) A couplet. (2) A couple. (*b*) The general name for a great variety of mechanical appliances for uniting parts of constructions or parts of machines, for the purpose of adding strength, of transmitting motion from one part to another, or of making a continuous passage, as for a liquid, a gas, or an electric current. A buckle, binding-screw, or fish-plate may illustrate the first; a clevis, a bell-coupling, shaft-coupling, or car-coupling, the second; a pipe-coupling or binding-post, the last. In a narrower sense a coupling is: (1) A device for uniting the ends of shafting, or a coupling-box. (See cut under *coupling-box*.) Such couplings are divided into



two simple classes, those that are fixed permanently on the shafting and those that are adjustable, connected or not at will, or working automatically under variations of the power. Those operated by hand, whatever the particular application of the power, are called *shifting couplings*. The automatic couplings depend chiefly on friction, the adjustment being such that under a certain load the power is communicated, while a sudden addition to the load may exceed the friction and throw the coupling out of operation. (2) A device for uniting two railroad-cars in a train. The form at one time used almost exclusively in the United States, and still occasionally employed in freight-cars, is a single link or shackle fitting into jaws at the ends of the draw-bar and held in position by pins. This has been superseded on passenger-cars by self-acting couplings, consisting usually of hooked jaws, which slide past each other and are self-locking by means of springs or their own weight. Levers are also used to operate the couplings from the car-platform. Also called *coupler*. (*c*) The part which unites the front and rear axles, or the axle-bolster, of a carriage; the perch or reach. In some carriages the bottom of the carriage forms the only coupling. (*d*) The space between the tops of the shoulder-blades and the tops of the hip-joints of a dog.

The term denotes the proportionate length of a dog, which is spoken of as short or long in the *couplings*.
V. Shaw, Book of the Dog.



Ball-and-socket coupling. See *ball*[1].—**Differential coupling,** an extensible coupling designed for varying the speed of that part of the machinery which is driven.—**Disk coupling,** a kind of permanent coupling which consists of two disks keyed on the connected ends of the two shafts. In one of the disks there are two recesses, into which two corresponding projections on the other disk are received, and thus the two disks become locked together. This kind of coupling wants rigidity, and must be supported by a journal on each side, but it possesses the double advantage of being easily adjusted and disconnected.—**Dynamometer coupling.** See *dynamometer*.—**Flexible coupling,** a device for joining pieces of shafting which are not exactly in line, or of which the relative direction is varied in the course of the work, as in a dental engine. It consists of pairs of jointed arms united by universal joints, or of spiral springs fastened at each end to the two pieces of shafting that are to be united, or of plugs or rods of rubber fitted to the shafting.—**Flexible pipe-coupling,** a pipe-connection consisting of two bell-shaped joints with a short pipe between them, which fits into each bell and enables the two pipes to be laid out of line while yet keeping the joints tight.—**Half-hose coupling,** a coupling which has a sleeve at one end with an internal thread to receive a pipe, while a hose is bound on a corrugated tube-shaped portion at the opposite end.—**Half-lap coupling,** a kind of permanent coupling in which the boss-ends of the connected shafts are made semi-cylindrical, so that they overlap each other. The coupling-box is a plain cylinder bored to fit, and is kept in its place by a parallel key or feather, as shown in the annexed figure.—**Right-and-left coupling,** a turn-buckle.—**Sleeve coupling,** a tube within which the abutting ends of shafting are coupled together.—**Slip-clutch coupling,** a form of coupling belonging to the class of friction-couplings. It is represented in its best form in the annexed figure. On the shaft B is fixed a pulley, which is embraced by a friction-band *a* as tightly as may be required. This band is provided with projecting ears, with which the prongs *b b* of a fixed cross *d* on the driving-shaft A can be shifted into contact. This cross is free to slide endwise on its shaft, but is connected to it by a sunk feather, so that being thrown forward into gear with the ears of the friction-band, the shaft being in motion, the band slips round on its pulley until the friction becomes equal to the resistance, and the pulley gradually attains the same motion as the clutch. The arms and sockets *c c*, which are keyed fast on the shaft A, are intended to steady and support the prongs, and to remove the strain from the shifting part.—**Square coupling,** in *mill-work*, a kind of permanent coupling of which the coupling-box is made in halves and square, corresponding to the form of the two connected ends of the shafts. The two halves of the box are bolted together on the opposite sides, as represented in the annexed figure.—**Thimble coupling,** a kind of permanent coupling in which the coupling-box consists of a plain ring of metal, supposed to resemble a tailor's thimble, bored to fit the two connected ends of the shafts. The connection is secured either by pins passed through the ends of the shafts and the thimble, or by a parallel key or feather bedded in the boss-ends of the shafts, and let into a corresponding groove cut in the thimble. This last is now the more common mode of fitting. This kind of coupling is also known under the names of *ring coupling* and *jump-coupling*.

At each time of payment one is cut off and presented for payment. In the United States coupons are negotiable instruments on which suits may be brought though detached from the bond. A purchaser of an over-due coupon takes only the title of the seller. Negotiable coupons are entitled to days of grace. (*b*) One of a series of conjoined tickets which bind the issuer to make certain payments, perform some service (as transportation over connecting railroad lines), or give value for certain amounts at different periods, in consideration of money received. At the settlement of each claim a coupon is detached and given up.

See *Virginia coupon cases*, under *case*[1].—**Coupon ticket,** a ticket of admission to a place of amusement, entitling the holder to a specified seat, and printed in two parts, of which one is torn off and returned to the holder on entering.—**Virginia coupon cases.** See *case*[1].

In Scotland the superior courts are the Court of Session, Court of Justiciary, and Court of Exchequer. (*b*) A designation frequently prescribed by law, particularly in the United States, for a local court in a particular county or city, superior in jurisdiction to the lower class of inferior courts existing in the counties and towns throughout the State: as, the *Superior Court* of the city of New York (abolished); the *Superior Court* of Cincinnati; the *Superior Court* of Cook county. In Connecticut and Georgia the highest court of original jurisdiction is termed the Superior Court.—**Supreme court,** the designation usually prescribed by law for the highest court of the state or nation which has any original jurisdiction of a general nature. In the United States the name is usually given to the court having a general appellate jurisdiction over inferior courts, and original jurisdiction to supervise the proceedings of inferior courts and of public officers, by the special writs of mandamus, certiorari, prohibition, habeas corpus, quo warranto, and the like. The term has no fixed general meaning apart from the statute conferring it. For instance, in many States the jurisdiction of the Supreme Court is purely appellate and supervisory. In England the Supreme Court includes the various divisions, Chancery, Queen's Bench, etc. (formerly called the Superior Courts, which have original and appellate jurisdiction), and the Court of Appeal (which has no original jurisdiction, but reviews the proceedings of the various divisions); and the decisions of the Court of Appeal are in turn reviewed by appeal to the House of Lords. In New York the name is given to the court having general original jurisdiction at law and in equity throughout the State, of all classes of actions, civil and criminal, except such minor, local, and peculiar matters as for reasons of convenience are confined in the first instance to inferior courts; and its final judgments are for the most part subject to review in the Court of Appeals. But it has also appellate jurisdiction over many inferior courts. In New Jersey the Supreme Court has both original and appellate jurisdiction at law, while the equity jurisdiction is vested in the Court of Chancery, and both are subject to review in the Court of Errors and Appeals. In Connecticut the appellate court is termed the Supreme Court of Errors. In Massachusetts the Superior Court has original jurisdiction generally in both law and equity except where specially reserved to inferior courts from which it is appealed to, or to the Supreme Judicial Court to which, except in stated cases, appeals from it may be taken. The Supreme Court of the United States has original jurisdiction in cases affecting ambassadors and other public ministers and consuls, and those in which a State is a party. Its principal business is in the exercise of its appellate jurisdiction, which includes (subject to complex restrictions in many classes of causes) civil cases in the courts established by act of Congress; federal questions determined in State courts of last resort adversely to a claim of federal right; and a supervisory jurisdiction over criminal proceedings in United States circuit courts when two judges are disagreed.—**Surrogate's court,** in some of the United States, a probate court.—**The courts of the Lord,** the temple at Jerusalem; hence, a church or public place of worship.

Shak., J. C., ii. 2.

2. In *her.*, an animal represented with the tail hanging down, or turned up between the legs, as a lion or other beast of prey. Also *coué*.

=Syn. 1. *Coward*, *Poltroon*, *Craven*, *Dastard*, *Pusillanimous* (person) express an ignoble quality of fear, or fear showing itself in dishonorable ways. *Coward* is the general word, covering the others, is most often used, and is least opprobrious. *Poltroon*, *craven*, and *dastard* are highly energetic words, used only in the effort to make a person's cowardice seem contemptible. The distinction between them is not clearly marked. A *poltroon* has somewhat more of the mean-spirited and contemptible in his character; a *craven* skulks away, accepts any means of escape, however dishonorable, from a dangerous position, duty, etc.; a *dastard* is base, and therefore despicable, in his cowardice. *Dastard* is the strongest of these words. A *pusillanimous* person is, literally, one of little courage; his cowardice is only the most conspicuous part of a general lack of force in mind and character, making him spiritless and contemptible.

I was a *coward* on instinct. *Shak.*, 1 Hen. IV., ii. 4.

The tree is common in Venezuela, growing to the height of 100 feet. The leaves are leathery, about 1 foot long and 3 or 4 inches broad. The cow-tree of Pará is a sapotaceous tree, *Mimusops elata*, the milk of which resembles cream in consistence, but is too viscid to be a safe article of food. Also called *milk-tree.*

★**coxa** (kok'sä), *n.*; pl. *coxæ* (-sē). [L.] 1†. The femur or thigh-bone.—2. In *anat.*: (*a*) The hip-bone, os coxæ or os innominatum. (*b*) The hip-joint.—3. In *entom.*, the first or basal joint (sometimes called the hip) of an insect's leg, by which it is articulated to the body. It may be entirely uncovered, as in many flies, or received into a coxal cavity or deep hollow in the lower surface of the thorax, as in most beetles. Coxæ are said to be *contiguous* when those of a pair are close together, *separate* when there is a space between them, *distant* when they are widely separate, *prominent* when they protrude from the coxal cavities, *globose* when they are shaped like a ball, *transverse* when they lie across the body with the succeeding joint of the leg attached to the inner end, etc. These distinctions are of great value in classification. Sometimes the coxa has a small accessory piece called the *trochanter*, which, however, is not a true joint. Some of the older entomologists included the first two joints of the leg in the term *coxa*, the first being distinguished as the *patella* and the second as the *trochanter.*

They are distinguished as *anterior*, *median*, and *posterior*, and are said to be *entire* when they are completely closed behind by the junction of the sternum and epimera, *open* when a space is left protected only by membrane, *separate* when the sternum extends between them, and *confluent* when the sternum is not visible between them. Much use is made of these characters in classification.—**Coxal lines**, in *entom.*, two curved, slightly prominent lines on the first ventral abdominal segment of certain *Coleoptera*, behind the coxæ. They limit a space which is inclined toward the base of the abdomen, passing under the coxæ.

★**crane**[2] (krān), *n.* [A particular use of *crane*[1], the arm of the contrivance being likened to the neck of a crane. This use is not found in ME. or AS., and is prob. of D. origin: cf. MD. *kraene,* D. *kraan* = LG. *kran* (> also G. *krahn* = Sw. Dan. *kran*) = F. *crône,* a crane (a machine), = Gr. γέρανος, a crane (a machine), a particular use of the word for *crane,* a bird. The resemblance of Gael. and Ir. *crann,* a beam, mast, bar, tree, > *crannachan,* a crane (Ir. also a craner), is prob. accidental.] 1. A machine for moving weights, having two motions, one a direct lift and the other horizontal. The latter may be circular, radial, or universal. The parts of the simple crane are an upright post having a motion on its vertical axis, a jib or swinging arm jointed at its lower end to the post and tied to the post at its outer or upper end, and hoisting tackle connecting the motive power at the foot of the post with the load to be lifted, which is suspended from the end of the jib. Cranes are, however, made in a variety of forms, differing more or less from this type. Thus, a *rotary crane* is a crane in which the jib has simply a rotary motion about the axis of the post, moving with the post; a *traveling crane* is a crane in which the load is suspended from a carriage moving upon a long truss that travels upon elevated rails. See cut. In some fixed cranes the load is suspended from a carriage that travels on a horizontal arm at the top of the jib, and gives the load a movement along the radius of the circle formed by the rotation of the jib. Another minor type is the *derrick-crane,* with fixed guys to hold the post in position. Cranes (called *walking-cranes*) traveling upon rails have been used in navy-yards. Cranes are operated by any kind of power and with any form of hoisting apparatus suited to the work to be done. See also cut under *abutment-crane.*

The following craniometrical indices are distinguished: the *basilar index*, the ratio of the projection of that part of the skull on the horizontal plane which lies in front of the basion to the whole projection, multiplied by 100; the *cephalic index*, or *index of breadth*, the ratio of the maximum transverse to the maximum anteroposterior diameter of the skull, multiplied by 100; the *cephalo-orbital index*, the ratio of the solid contents of the two orbits to the contents of the cranial cavity, multiplied by 100; the *cephalospinal index*, the ratio of the measure of the foramen magnum in square millimeters to that of the cranial cavity in cubic centimeters, multiplied by 100; the *cerebral index*, the ratio of the greatest transverse to the greatest anteroposterior diameter of the cranial cavity, multiplied by 100; the *facial index*, the ratio of the distance of the ophryon from the alveolar point to the transverse diameter measured from one zygoma to the other, multiplied by 100; the *gnathic* or *alveolar index*, the ratio of the distance between the basion and alveolar point to the distance between the basion and nasal point, multiplied by 100; the *nasal index*, the ratio of the maximum breadth of the anterior orifice of the nose to the distance from the nasal to the subnasal point, multiplied by 100; the *orbital index*, the ratio of the vertical to the transverse diameter of one of the orbits, multiplied by 100; and the *vertical index*, or *index of height*, the ratio of the vertical diameter of the skull to the maximum anteroposterior diameter, multiplied by 100.

The *single crank* (1) can be used only on the end of an axis. The *double crank* (2) is employed when it is necessary that the axis should be extended on both sides of the point at which the reciprocating motion is applied. An exemplification of this arrangement is afforded by the machinery of steam-vessels. The *bell-crank* (3), so called from its ordinary use in bell-hanging, performs a function totally different from that of the others, being used merely to change the direction of a reciprocating motion, as from a horizontal to a vertical line.

When first introduced, it was commonly of lace, or of linen edged with lace. At the beginning of the seventeenth century it was worn very long, and it is often seen in pictures passed through the buttonhole of the coat or waistcoat.

(See *steinkirk.*) The modern cravat is rather a necktie, passed once round the neck, and tied in front in a bow, or, as about 1840 and earlier (when the cravat consisted of a triangular silk kerchief, usually black), twice round the neck, in imitation of the stock. Formerly, when starched linen cravats were worn, perfection in the art of tying them was one of the great accomplishments of a dandy. The cravat differs properly from the scarf, which, whether tied, or passed through a ring, or held by a pin, hangs down over the shirt-front. In England *neckcloth* is the usual word in this sense.

The handkerchief about his neck,
Canonical *crabat* of Smeck.

Such associations are of two kinds: (*a*) Those in which the association lends money on real estate at a fixed rate of interest, and issues stock based on the property thus pledged, promising to pay a fixed rate of interest thereon. The stock may be bought by any person. The purchaser, in effect, buys the stock on the promise of the borrower coupled with the pledge of his property, and on the further promise of the association. This form is common in Germany. (*b*) Those in which the loan is repaid by instalments or annuities extending over a period of years, generally fifty. Associations of this kind are common in France.

Crédit Mobilier (kred'it mō-bē'liėr; F. pron. krā-dē' mo-bē-lyā'). [F., lit. personal credit: *crédit*, credit; *mobilier*, personal (of property), < *mobile*, movable: see *credit*, *n.*, and *mobile.*] **1.** In *French hist.*, a banking corporation formed in 1852, under the name of the "Société générale du Crédit Mobilier," with a capital of 60,000,000 francs, for the placing of loans, handling the stocks of all other companies, and the transaction of a general banking business. It engaged in very extensive transactions, buying, selling, and loaning in such a manner as to bring into one organized whole all the stocks and credit of France, and was apparently in a most prosperous condition until it proposed to issue bonds to the amount of 240,000,000 francs. This amount of paper currency frightened financiers, and the government forbade its issue. From this time the company rapidly declined, and closed its affairs in 1867, with great loss to all but its proprietors.

2. In *U. S. hist.*, a similar corporation chartered in Pennsylvania in 1859 and organized in 1863 with a capital of $2,500,000. Later, after passing into new hands, and increasing its stock to $3,750,000, it became a company for the building of the Union Pacific railroad. For a few years it paid large dividends, and its stock rose in value. In a trial in Pennsylvania in 1872 as to the ownership of some stock, it was shown that certain congressmen secretly possessed stock, and both houses of Congress that met in December of that year appointed committees of investigation. The Senate committee recommended the expulsion of one member; but the Senate did nothing. The House committee recommended the expulsion of two of its members; but the House, instead, passed resolutions of censure.

In the Protestant churches the authority of creeds is relative and limited, and always subordinate to the Bible as the only infallible rule of faith and practice. In the Greek and Roman Catholic churches the creed of the church is regarded as of equal authority over the believer with the Bible. The principal historical creeds of Christendom are the following: the *Apostles' Creed* (see *apostle*) and the *Nicene Creed* (see *Nicene*), the latter formulated in the fourth century, and generally accepted by Christian churches, Protestant, Greek, and Roman Catholic; the *Athanasian Creed* (see *Athanasian*), retained by the Church of England, but not by the Protestant Episcopal Church in the United States, nor by other Protestant communities; the *Decrees of the Council of Trent* (A.D. 1563), the great symbol of Roman Catholicism; the *Orthodox Confession of Mogilas* (seventeenth century), and the creed ratified by the Synod of Jerusalem (1672), both recognized by the Greek Church, the *Augsburg Confession* (1530), the symbol of the Lutheran Church; the *Helvetic Confessions* (two confessions, a first and a second Helvetic Confession, 1536, 1566), adopted by Swiss theologians as a statement of the reformed faith of the Swiss churches; the *Westminster Confession of Faith* (1647), the symbol of the Presbyterian Church; the *Canons of the Synod of Dort* (1619), aimed especially at Arminianism, and still regarded as a symbol of doctrine by the Reformed Church of the Netherlands and the Reformed (Dutch) Church in America; the *Thirty-nine Articles* (1563–71) of the Church of England and (revised in 1801) of the Protestant Episcopal Church in the United States; the *Savoy Confession* (1658), a Congregational symbol, and formerly generally accepted by Congregationalists; and the *Twenty-five Articles of the Methodist Episcopal Church* (1784), of which the first twenty-four were prepared by John Wesley, on the basis of the Thirty-nine Articles of the Church of England. A number of other special declarations of faith by other Protestant bodies are of less historical significance. The word *creed*, however, in its strict sense applies only to comparatively brief formulas of profession of faith (as the Apostles' Creed), beginning with the words "I believe" or "We believe," and intended to be used at baptism or reception of converts, or in public worship.

Also wher the Postyllys [Apostles] made *Crede* of ower feyth. *Torkington*, Diarie of Eng. Travell, p. 29.

The revival of the practice in a more efficient manner has been advocated in recent times for sanitary reasons, and to some extent effected. In W. Siemens's apparatus (a modification of the plan of Sir Henry Thompson) the body is exposed to the combined action of highly heated air and combustible gases, so as to be entirely consumed without foreign admixture, while the furnace is so constructed that no noxious effluvium escapes from it.

It. *cresta* = Pg. *crista*, < L. *crista*, a comb or tuft on the head of a bird or serpent, a crest.] 1. > *C. Pitt*, tr. of Vida's Art of Poetry.

Crests proper belong to the top of the head, but may be also held to include such growths on its side. . . . *Crests* may be divided into two kinds: 1, where the feathers are simply lengthened or otherwise enlarged; and 2, where the texture, and sometimes even the structure, is altered. Nearly all birds possess the power of moving and elevating the feathers on the head, simulating a slight *crest* in moments of excitement. *Coues*, Key to N. A. Birds, p. 99.

2. Anything resembling, suggestive of, or occupying the same relative position as a crest. (*a*) An article of dress or ornament; specifically, in *armor*, an upright ornament of a helmet, especially when not long and floating like a plume of feathers or a cointoise, as a ridge of metal, hair, bristles, feathers, or the like. (Compare *aigret*.) The crest in medieval armor was early affected by heraldic considerations (see (*b*)), whether formally, as being the heraldic crest itself, or by the necessity of using a badge or cognizance, whether temporary or permanent: thus, the tilting-helmet was often surmounted by an elaborate structure in cuir-bouilli or even in thin metal, representing an animal or the head of an animal, or a human figure.

cards in counting have a value according to the number of pips or spots on them, the court cards counting as 10 each, all others at their face value. After laying out for the crib, the cards are played from the hand one at a time by each player alternately, each striving to pair or match his adversary's card, or to make the total pip count equal 15 or 31, or to make sequences of not less than three cards. cricket2 (krik'et), *n.* [The game is first mentioned in A. D. 1598; evidently a popular name, poss. a particular use of *cricket*, a low stool, in allusion to the appearance of the wickets or sticks in the original game. Some cite OF. *criquet*, a stick which serves as a mark in the game of bowls (Roquefort).] An open-air game played with bats, ball, and wickets, long peculiar to England, but now played throughout the British empire and elsewhere. There are two opposite sets or sides of players, numbering 11 players each. Two wickets of 3 stumps 27 inches high, with 2 bails each 4 inches long on top, are placed in the ground 22 yards apart. A straight line, 6 feet 8 inches in length, known as the bowling-crease, is drawn on the ground, through the wickets, which must be in the middle of this line. Behind this the bowler must stand. Four feet in front of this is another line, known as the *popping-crease*, of at least as great a length as the bowling-crease; between these two the batsman stands. After the rival sides have tossed for the choice of taking the bat or fielding, two men are sent to the wickets, bat in hand. The opposite or fielding side are all simultaneously engaged: one (the bowler) being stationed behind one wicket for the purpose of bowling his ball against the opposite wicket,

where another player (the wicket-keeper) stands ready to catch the ball should it not be batted; the other fielders are placed in different parts of the field, so as to catch or stop the ball after it has been struck by the batsman or missed by the wicket-keeper. Their positions and names are shown in the diagram. It is the object of the batsman to prevent the ball delivered by the bowler from knocking the bails off his wicket, either by merely stopping the ball with his bat or driving it away to a distant part of the field. Should the ball be driven to any distance, or not stopped by the wicket-keeper, the two batsmen run across and exchange wickets once or more. Each time this is done is counted as a "run," and is marked to the credit of the striker. If the batsman, however, allows the ball to carry away a bail or a stump, either when the ball is bowled or while he is running from wicket to wicket, if he knocks down any part of his own wicket, if any part of his person stops a ball that would otherwise have reached his wicket, or if he strikes a ball so that it is caught by one of the opposite party before it reaches the ground, he is "out"—that is, he gives up his place to one of his own side; and so the game goes on until 10 of the 11 men have played and been put out. This constitutes an "innings." The side in the field then take their turn at the bat. Generally after two innings have been played by both sides the game comes to an end, that side winning which has scored the greater number of runs. A rude form of the game is known to have been played in the thirteenth century.

From the club-ball originated . . . that pleasant and manly exercise, distinguished in modern times by the name of *cricket*. *Strutt*, Sports and Pastimes, p. 175.

(*b*) Charges of offense against the public law of the state or nation, as distinguished from violations of municipal or local ordinances.—**Criminal contempt.** See *contempt*.—**Criminal conversation**, in *law*: (*a*) Adultery; specifically, illicit intercourse with a married woman. (*b*) The husband's action for damages for adultery. This action has been abolished in England by 20 and 21 Vict., lxxxv. 59, but the husband, in suing for a divorce, may claim damages from the adulterer. The action has not been abolished in the United States. Often abbreviated *crim. con.*—**Criminal information**, a prosecution for crime instituted by the attorney-general, in the name of the crown or the people, without requiring the sanction of a grand jury.—**Criminal law**, the law which relates to crimes and their punishment. Certain matters of a quasi-criminal character, such as indictments for nuisances, repair of roads, bridges, etc., informations, the judicial decisions of questions concerning the poor-laws, bastardy, etc., are also often treated as part of the criminal law.—**Criminal letters**, a form of criminal prosecution in Scotland, corresponding to a criminal information in England, drawn in the form of a summons, and in the supreme court running in the name of the sovereign, in the sheriff-court in that of the sheriff.—**Criminal prosecution**, the proceeding by which a person accused of a crime is brought or attempted to be brought to trial and judgment. Sometimes confined to prosecution by indictment.—**Criminal psychology.** See *psychology*.=**Syn. 2.** *Illegal*, *Criminal*, *Felonious*, *Sinful*, *Immoral*, *Wicked*, *Iniquitous*, *Depraved*, *Dissolute*, *Vicious*, agree in characterizing an act as contrary to law, civil or moral. All except *illegal* and *felonious* are also applicable to persons, thoughts, character, etc. *Illegal* is simply that which is not permitted by human law, or is vitiated by lack of compliance with legal forms: as, an *illegal* election. It suggests penalty only remotely if at all. *Criminal* applies to transgressions of human law, with especial reference to penalty. *Felonious* applies to that which is deliberately done in the consciousness that it is a crime; its other uses are nearly or quite obsolete. *Sinful* and the words that follow it mark transgression of the divine or moral law. *Sinful* does not admit the idea that there is a moral law separate from the divine will, but is specifically expressive of "any want of conformity unto, or transgression of, the will of God" (*Shorter Catechism*, Q. 14). As such, it applies to thoughts, feelings, desires, character, while human law looks no further back of action than to intent (as, a *criminal* intent), and attempts to deal only with acts. Hence, though all men are *sinful*, all are not *criminal*. *Immoral* stands over against *sinful* in emphasizing the notion of a moral law, apart from the question of the divine will; its most frequent application is to transgressions of the moral code in regard to the indulgence of lust. *Wicked* bears the same relation to moral law that *felonious* bears to civil law; the *wicked* man does wrong wilfully and knowingly, and generally his conduct is very wrong. *Iniquitous* is wicked in relation to others' rights, and grossly unjust: as, a most *iniquitous* proceeding. *Depraved* implies a fall from a better character, not only into wickedness, but into such corruption that the person delights in evil for its own sake. *Dissolute*, literally, set loose or released, expresses the character, life, etc., of one who throws off all moral obligation. *Vicious*, starting with the notion of being addicted to vice, has a wide range of meaning, from cross to wicked; it is the only one of these words that may be applied to animals. See *crime*, *atrocious*, *nefarious*, and *irreligious*.

II. *n.* One of the *Crinoidea;* an encrinite; a stone-lily, sea-lily, lily-star, feather-star, or hair-star.

The greater number of *crinoids* belong to the oldest periods of the history of the earth (the Cambrian, Silurian, Devonian and Carboniferous formations). Existing forms live mostly at considerable depths.

Crinoidea (kri-noi′dē-ạ), *n. pl.* [NL., < Gr. *κρινοειδής*, like a lily, < *κρίνον*, a lily, + *εἶδος*, form.] A class of the pelmatozoan branch of the *Echinoderma* containing those forms which, during the whole or the early part of their existence, are fixed by a jointed, flexible stalk or are attached by the lower surface of the body: so named from the resemblance of their rayed bodies,

Rhizocrinus lofotensis.

I. The entire animal: *a*, enlarged upper joint of stem; *b*, larval joints of stem; *c*, *c*, cirri; *d*, *d*, brachia. II. Summit of stem, bearing calyx and brachia: *a*, as before; *r*[2], *r*[2], first radials; *r*[2], *r*[2], second radials; *r*[3], *r*[3], third radials; *p*, *p*, pinnules. III. Oral surface of calyx, seen obliquely: *v*, lower part of visceral mass; *st*, tentacular grooves; *o*, *o*, oral valves; *t*, oral tentacles; *an*, anus.

borne on a stalk, to a lily. The principal viscera are inclosed in a cup-shaped or globose calyx, the lower part of which — the dorsal or aboral surface — is composed of calcareous, close-fitting plates and usually rests on the peduncle or stalk; its upper surface — the ventral — is either plated or membranous; the mouth is situated here, but is usually subtegminal in Paleozoic forms. The arms, or crown, arise from the upper part of the calyx and are the direct prolongation of the radial plates of the dorsal calyx. These arms bear lateral branches or pinnules; both are traversed ventrally by a deep groove, at the bottom of which is situated the cœliac canal. Overlying the latter run the genital, water-, and vascular canals, a nerve-cord, and two rows of tentacles passing out from the ambulacra. These arm-furrows lead downward into the tegmen and to the mouth. The *Crinoidea* were enormously abundant in Paleozoic time, when they attained their culmination. Their fossil remains are popularly known as stone-lilies, lily-stars, encrinites, etc. They sometimes constitute entire strata of limestone. In recent seas crinoids are of relatively rare occurrence and are represented by only a very few genera. In the accepted classification, the class is divided into five orders: *Larviformia, Camerata, Fistulata, Flexibilia*, and *Articulata*. Also called *Brachiata*.

A stiff material originally made wholly or in part of horsehair, whence the name. It was used about 1852 for stiff skirts, and, when this fashion was followed by that of wearing greatly projecting skirts of wire or steel springs, the word continued to be used generally for the latter. Crinoline is still in use for stiff lining and the like, in the manner of buckram.

2. In *logic*, a sophism of counter-questioning. Thus, in the old example, a crocodile has stolen a child, and promises to restore it to the father if the latter answers correctly his question, Am I going to restore the child? If the father says Yes, the crocodile eats the child and tells the father he is wrong. If the father says No, the reply is that in that case the child cannot be restored, for to do so would violate the agreement, since the father's answer would then be incorrect.

Crocodilia (krok-ō-dil'i-ă), *n. pl.* [NL., < L. *crocodilus*, crocodile.] An order of *Reptilia*, formerly included with *Lacertilia* in *Sauria*, now separated as the highest existing reptiles. They are lizard-like in form, with long tails and four well-developed limbs, the anterior shorter than the posterior and with five complete digits, and the posterior four-toed. With a single exception, the living species have nails on the three radial and tibial digits; the feet are webbed; the nostrils are at the end of a long snout, and can be closed; and the tympanic membranes are exposed, but a cutaneous valve can be shut down over them. The skin is loricate, the dermal armor consisting of bony scutes covered with epidermal scales of corresponding form; the anus is longitudinal, as in the chelonians; the penis is single, and lodged in the cloaca; the teeth are distinctly socketed; the lungs are confined to the thorax; the heart is completely four-chambered, but the aortic arches communicate by the foramen Panizzæ, so that venous and arterial blood commingle outside the heart; the spinal column is well ossified; the vertebræ are mostly procœlous, as in all the existing species, amphicœlous or opisthocœlous in some extinct forms; the sacral vertebræ are reduced to two; the cervical bear free ribs; the ribs are bifurcated at their proximal ends; there is a series of so-called abdominal ribs disconnected from the vertebræ; and the skull is well ossified, with an interorbital septum, large alisphenoids and parotic processes, large fixed quadrates, ectopterygoids, completely bony tympanic cavities, rudimentary orbitosphenoids, if any, and no parietal foramen. The order ranges in time from the Oölitic strata to the present day, and contains all the huge saurians known as crocodiles, alligators, caymans, jacarés, gavials, etc. All the species are more or less aquatic, though none of the living ones is marine. The order has been divided into the five families *Alligatoridæ*, *Crocodilidæ*, *Gavialidæ*, *Teleosauridæ*, and *Belodontidæ*, the last two including only extinct forms. Other names of the order are *Loricata*, *Emydosauria*, and *Hydrosauria*. Other divisions of the order than those above given are: (1) by Owen, into three suborders, *Procœlia*, *Amphicœlia*, and *Opisthocœlia*; and (2) by Huxley, likewise into three suborders, *Parasuchia*, *Mesosuchia*, and *Eusuchia*.

The object of the game is, starting from one end of the field, to drive the balls through the hoops to the peg at the opposite end of the field, and then back again to the first peg, or winning-peg, the player or side doing this first winning the game. The order, position, shape, and number of the hoops differ in different forms of the game. Their arrangement and the order in which they are taken, in the form of the game (also known as roque) adopted by the National American Croquet Association, are shown in the illustration. The (earth) court is 72 by 36 feet in size (with corners 8 feet long), surrounded by a border, 30 inches within which is marked the boundary of the field. The arches are 3½ inches between the wires, except the central double arch, or cage, in which the width is 8½ inches. When played on a grass court or a lawn the field is commonly 90 by 45 feet, there is a single central wicket parallel with the other wickets, and the side wickets are set one foot forward (toward the center) instead of being on a line with the second (or sixth) wicket. The ball also is sent through the fifth and the tenth wickets (counting the double middle wicket twice) in the direction opposite to that shown in the diagram. Croquet can be played by two or more, and, in the case of several playing, they may either be divided into two parties or play each for himself.

1. A structure consisting essentially of an upright and a crosspiece, anciently used as a gibbet in punishment by crucifixion, now, in various reduced or representative forms, as a symbol of the Christian faith. There are four principal forms of the cross: (1) the *Latin cross*, or *crux immissa* or *capitata* (the form supposed to have been used in the crucifixion of Christ), in which the upright is longer than the transverse beam, and is crossed by it near the top; (2) the *crux decussata* (decussate cross), or *St. Andrew's cross*, made in the form of an X; (3) the *crux commissa*, or *St. Anthony's cross*, made in the form of a T; (4) the *Greek cross*, an upright crossed in the middle at right angles by a beam of the same length. The other forms are, for the most part, inventions for ecclesiastical, hierarchic, or similar ends. See the phrases below, and *crucifixion*.

2. A structure or monument in the form of a cross, or with a cross upon it, set up by the wayside, in market-places, etc., in Greek and Roman Catholic countries, to excite devotion. Such crosses are made in various forms, according to the occasion or purpose of their erection. *Preaching-crosses* are generally quadrangular or hexagonal, open on one or both sides, and raised on steps. They were used for the delivery of sermons in the open air. See *preaching-cross*. *Market-crosses* consisted originally of a long shaft raised on a series of steps and surmounted with a cross. Subsequently an arched or vaulted structure supported on pillars was erected round the central shaft. See *market-cross*. *Weeping-crosses* were so called because penances were finished before them. *Crosses of memorial*, or *memorial crosses*, were raised on various occasions, as, for example, in attestation of some miracle said to have been performed on the spot. Another class is the *monumental* or *sepulchral cross*, erected over a grave, or where a corpse was set down on the way to burial, like those erected by King Edward I. at the several places where the corpse of his queen, Eleanor, rested in its progress from Lincolnshire to the place of interment in Westminster. The *palm-cross* was a monumental cross decorated with palm-branches on Palm Sunday. *Boundary crosses* were erected as landmarks.

★**crow**[2] (krō), *n.* [< ME. *crow*, *craw*, *crowe*, *crawe*, < AS. *crāwe* = OS. *krāia* = D. *kraai* = MLG. *krā*, *krāge* = OHG. *chrāja*, *chrāwa*, *chrāa*, *chrā*, MHG. *krā*, *krœje*, G. *krähe*, a crow, a raven; from the verb, AS. *crāwan*, etc., crow (orig. in a general sense). Cf. E. dial. *crake*, a crow, Icel. *kráka*, a crow: see *crake*[2], *croak*, etc.] **1.** A general name including most birds of the genus *Corvus* and of the family *Corvidæ*; especially, one of the *Corvinæ*. See these three words. The larger kinds of crows are called *ravens*, especially those which have the throat-feathers lengthened, lanceolate, and discrete. The term, used absolutely, means in Great Britain the carrion-crow, *Corvus corone*, and in the United States the common American crow, *C. americanus*. The two species are so similar in all respects that they are only distinguished by slight technical characters. The plumage is jet-black, with a purplish and violet gloss or sheen, especially on the back, wings, and tail; the bill and feet are ebony-black; the base of the upper mandible is covered for a long distance with a bundle of antrorse bristly feathers, filling each nasal fossa and hiding the nostrils. The eyes are bright and intelligent, of a hazel-brown color. The feet are stout, with strong curved claws and scaly tarsi and toes. The tail is of moderate length, a little rounded or fan-shaped, of 12 broad plane feathers. The wings are lengthened and pointed, with 10 primaries, and when folded their tips fall nearly opposite the end of the tail. The length of these crows is 18 or 20 inches. Crows are among the most omnivorous of birds, eating almost everything from carrion to fruits. Some species, hence called *fish-crows*, are fond of fish and shell-fish, as mollusks and crustaceans. Crows usually nest in trees, where they build large bulky nests of sticks, and lay greenish eggs heavily spotted with dark colors, generally to the number of 4, 5, or 6. They are noted for their sagacity, and in populous countries become extremely wary and knowing birds, their instinct of self-preservation being developed to the highest degree by the incessant persecution to which they are subjected.

Carrion-crow (*Corvus corone*).

Opinions differ as to their being on the whole most beneficial or most injurious to the agriculturist, but they are generally classed as "vermin," and in some places a legal price is set upon their heads. Crows are eminently sociable birds, and however widely they may be dispersed in pairs in the breeding season, they flock at other times; and in winter, in many places in the United States, vast bands numbering hundreds of thousands assemble nightly to roost together, often flying 20 to 40 miles back to these *crow-roosts* at night after foraging over the country for food during the earlier hours of the day. The common American fish-crow is *C. ossifragus* or *C. maritimus*, an undersized species inhabiting southerly parts of the United States, especially coastwise, and feeding much on shell-fish. The northwestern fish-crow is *C. caurinus*, a similar though distinct species. The white-necked crow or raven is *C. cryptoleucus*, of western parts of the United States, in which the plumage of the neck beneath the black surface is snowy-white. A number of small crows resembling the fish-crow inhabit the West Indies, as *C. jamaicensis*. In some of these the face is partially naked, a character which is also conspicuous in the European rook, a kind of crow, *C. frugilegus*. The European daw, *C. monedula*, is another kind of crow. See also phrases below.

crow-blackbird (krō'blak'bėrd), *n.* A name of the purple grackle, *Quiscalus purpureus*, an American passerine bird of the family *Icteridæ* and subfamily *Quiscalinæ*, common in the eastern United States: so called from its large size and dark color, which give it somewhat the appearance of a crow. The male is about 13 inches long and 17¾ inches in extent of wings. The plumage is richly iridescent, with green, blue, violet, purple, and bronzy tints; the bill and feet are ebony-black; the iris is straw-yellow; the tail is somewhat boat-shaped. The female is blackish and quite lustrous, in this differing from some related species, and also a little smaller than the male. A variety has a perfectly brassy back and steel-blue head; it is sometimes distinguished as the *bronzed* crow-blackbird. The name is extended to the other species of the same genus. *Q. major* is a larger species of the southern United States, known as the *boat-tailed crow-blackbird* or *grackle*, and locally called *jackdaw*. The tail is much carinated, and the disproportion in size of the sexes is very great, the female being only about 13 inches long, while the male is 15½ to 17; the peculiar development of the tail is lacking in the female, and the color is plain grayish-brown, the male being richly iridescent black. A still larger species, the *fan-tailed crow-blackbird*, *Q. macrurus*, also called *Texas grackle*, inhabits the Gulf States and Mexico; the male attains a length of 18 inches, while the female is much smaller. All these birds are gregarious, nest in trees and bushes, sometimes in holes, and lay 5 or 6 greenish eggs, clouded, veined, and scratched with various dark colors.

The tuning of the strings is disputed, but the compass of the instrument was probably from two to three octaves upward from about tenor G.

2. An ornament or covering for the head worn as a symbol of sovereignty. Crowns were of very varied forms till heralds devised a regular series to mark the grades of rank, from the imperial crown to the baron's coronet. (See *coronet*[1], 2.) The crown of England is a gold circle, adorned with pearls and precious stones, from which rise alternately four Maltese crosses and four fleurs-de-lis. From the tops of the crosses spring imperial arches, closing under a mound and cross. Within the crown is a crimson velvet cap with an ermine border. The crown of Charlemagne, which is preserved in the imperial treasury of Vienna, is composed of eight plates of gold, four large and four small, connected by hinges. The large plates are studded with precious stones, the front one being surmounted with a cross; the smaller ones, placed alternately with these, are ornamented with enamels representing Solomon, David, Hezekiah, and Isaiah, and Christ seated between two flaming seraphim. The Austrian crown is a sort of cleft tiara, having in the middle a semicircle of gold supporting a mound and cross; the tiara rests on a circle with pendants like those of a miter. The Russian crown is a modified form of the same imperial crown. The royal crown of France is a circle ornamented with eight fleurs-de-lis, from which rise as many quarter-circles closing under a double fleur-de-lis. The triple crown of the popes is more commonly called the *tiara*. (See *diadem*.) In heraldry the crown is used as a bearing in many forms. When a coronet or open crown is used to alter or differentiate a bearing, whether on the escutcheon or as a crest or supporter, it is not blazoned by itself, but the bearing is said to be *crowned*; when it is placed around the neck of an animal, the animal is said to be *gorged*.

In *geom.*, the area inclosed between two concentric circles.—**12.** In *bot.*, a circle of appendages on the throat of the corolla, etc. See *corona*, 6.—**13.** A coin generally bearing a crown or a crowned head on the reverse. The English crown is worth 5 shillings or $1.22, and was issued by Edward VI. in 1551, and by his successors. The obverse type of the crowns of Edward VI., James I., and Charles I. is the king on horseback, but from Charles II. to Victoria the obverse type is the head of the king or queen. The rare piece known as the *Oxford crown* was made, under Charles I., by the engraver Rawlins, and bears on the obverse a small view of Oxford, in addition to the ordinary type. The *petition-crown* is a pattern or trial-piece for a crown of Charles II., bearing the petition of its engraver, Thomas Simon, praying the king to compare the coin with the crown of the Dutch engraver John Roettier, by whom Simon had been superseded at the English mint. The *crown of the rose*, *crown of the double rose*, *double crown*, *Britain-crown*, and *thistle-crown* were English gold coins. The crown of the rose was first introduced by Henry VIII. in 1526, and was made current for 4*s.* 6*d.* The crowns of Denmark, Norway, and Sweden are now worth 26.8 cents. The old crown of Denmark was 4 marks of crown money, or $1.23. The crown of Holland was 87 cents; that of Brabant, $1.07; that of France, $1.12 (that is, the *écu* at the beginning of the eighteenth century; but the old *écu de la couronne*, properly so called, varied from $1.50 to $2.20); that of Bern, 90 cents; that of Zurich, 89 cents; that of Basel, 85 cents. The new Austrian gold crown is worth 20.3 cents. Twenty-crown and ten-crown pieces are coined. The German double-crown is the 20-mark gold piece and the half-crown the 5-mark gold piece. See *krone*. The name was also often used in English to translate the Italian *scudo*.

Archimedes is said to have solved the problem by immersing the crown in water, but whether by observing the rise of the water in the vessel, or, as seems more probable, by ascertaining the loss of weight, is a point of disagreement among the authorities.—**Mural crown.** See *mural*.—**Naval crown**, among the ancient Romans, a crown adorned with figures of prows of ships, and conferred on a naval commander who had gained a signal victory, or on the person who first boarded an enemy's ship. The lands belonging to the British crown are now usually surrendered to the country at the beginning of every sovereign's reign, in return for an allowance fixed at a certain amount for the reign by Parliament. They are placed under commissioners, and the revenue derived from them becomes part of the consolidated fund.

The additional allowances thus granted by Parliament to the Prince and Princess of Wales, and other members of the Royal Family, amount to an annual charge of £156,000; and when it is remembered that the *Crown lands* alone surrendered to Parliament yield an annual income of nearly £380,000, it will be evident that the charge upon the nation for the support of the dignity of Royalty is by no means extravagant, as interested persons would sometimes have us believe.

This meaning of the word is derived from Bacon's phrase *instantia crucis*, which he explains as a metaphor from a finger-post (*crux*). The supposed reference to a judicial "test of the cross," as well as that to the testing of metals in a crucible, which different writers have thought they found in the expression, are unknown to as learned a lawyer and a chemist as Bacon and Boyle. These supposed derivations have, however, influenced some writers in their use of the word.

Pg. *cruzada* = It. *crociata*, < ML. *cruciata*, a crusade, lit. (sc. *expeditio(n-)*) an expedition of persons marked with or bearing the sign of the cross, prop. fem. pp. of *cruciare*, mark with the cross, < L. *crux* (*cruc-*), cross: see *cross*[1], *n.* and *v.*, and *cruciate*. The earlier ME. word for 'crusade' was *croisery*: see *croisery*.] **1.** A military expedition under the banner of the cross; specifically, one of the medieval expeditions undertaken by the Christians of Europe for the recovery of the Holy Land from the Mohammedans. The crusading spirit was aroused throughout Europe in 1095 by the preaching of the monk Peter the Hermit, who with Walter the Penniless set out in 1096 with an immense rabble, who were nearly all destroyed on the way. The first real crusade, under Godfrey of Bouillon, 1096–9, resulted in the capture of Jerusalem and the establishment of a Christian kingdom in the Holy Land; the second, 1147, preached by St. Bernard, was unsuccessful; the third, 1189–92, led by the princes Frederick Barbarossa of Germany, Richard the Lion-hearted of England, and Philip Augustus of France, failed to recover Jerusalem, which the Mussulmans had taken in 1187; the fourth, 1202–4, ended in the establishment of a Latin empire in Constantinople, under Count Baldwin of Flanders, one of its leaders; the fifth, 1228–9, under the emperor Frederick II., the sixth, 1248–50, under St. Louis (Louis IX. of France), and the seventh and last, 1270–71, also under St. Louis, were all unsuccessful. There were other expeditions called crusades, including one of boys, 1212, "the children's crusade," in which many thousands perished by shipwreck or were enslaved. The cost of the crusades and the loss of life in them were enormous, but they stimulated commerce and the interchange of ideas between the West and the East. The expeditions against the Albigenses under papal auspices, 1207–29, were also called crusades.

For the *crusade* preached through western christendom, A. D. 1188, it was ordained that the English should wear a white cross; the French a red; the Flemish a green one.
Quoted in *Rock's* Church of our Fathers, III. i. 446, note.

The *Crusades*, with all their drawbacks, were the trial feat of a new world, a reconstituted Christendom, striving after a better ideal than that of piracy and fraternal bloodshed. *Stubbs*, Medieval and Modern Hist., p. 222.

If other pilgrims had their peculiar marks, so too had the *crusader*. For a token of that vow which he had plighted, he always wore a cross sewed to his dress, until he went to, and all the while he stayed in, the Holy Land.
Rock, Church of our Fathers, III. i. 446.

With all their faults these nobles [of Cyprus] were bona fide *Crusaders*; men who, like the first champions, were ready to cast in their lot in a Promised Land, and not, like the later adventurers, anxious merely to get all they could out of it, to make their fortunes.

Crustacea (krus-tā'shiä), *n. pl.* [NL., neut. pl. of *crustaceus*, having a crust: see *crustaceous*. Cf. L. *crustata*, shell-fish: see *crustate*.] A class of *Arthropoda*; one of the prime divisions of articulated animals with articulated legs, as distinguished from *Insecta*, *Myriapoda*, and *Arachnida* respectively. They are mostly aquatic arthropods with (generally) two pairs of antennæ and numerous thoracic as well as (usually) abdominal articulated appendages, and breathing by means of branchiæ. The body is covered with a hard chitinous test or crust, whence the name. It is segmented into head, thorax, and abdomen, the two former of which are more or less completely united into a cephalothorax, shielded with a continuous carapace; the abdomen is usually segmented and mobile, presenting the appearance of a tail. A typical segment or somite of the body consists, at least theoretically, of a dorsal portion or tergite of two pieces, a ventral portion or sternite, also of two pieces, an epimeron on each side above, and an episternum on each side below. The shell sends inward sundry hard processes or partitions called apodemata. The typical number of segments in the higher *Crustacea* is 21, actually or theoretically. The crustaceans shed their shells (exoskeletons), in some cases with extraordinary frequency, and they possess great reparatory powers in the reproduction of lost parts. Most of them pass through several larval stages, the best-marked of which are those of the forms called the *nauplius*, *zoëa*, and *megalopa*. The crustaceans include all kinds of crabs and lobsters, shrimps, prawns, crawfish, etc., among the higher forms; and among the lower, a great variety of creatures known as sand-hoppers, beach-fleas, wood-lice, fish-lice, barnacles, etc. Leading types, in more technical terms, are the thoracostracan, podophthalmic, or stalk-eyed crustaceans, as crabs and crawfish; the edriophthalmous or sessile-eyed crustaceans, as læmodipods, amphipods, and isopods (all the foregoing being sometimes grouped together as malacostracous crustaceans); the entomostracous crustaceans, as the copepods, ostracodes, cladocerans, phyllopods, etc., the trilobites and their related forms being often brought under this division; the epizoans, ichthyophthirians, or fish-lice; and finally, the cirripeds. Great as is the difference between extremes in any of these forms, they are closely related by connecting forms, and naturalists are by no means agreed upon the formal division of the class. The older divisions which have been made are now mostly superseded, and even the modern ones are seldom exactly conterminous. A series of subclasses sometimes now adopted is: (1) *Cirripedia* or *Pectostraca*, with three or four orders; (2) *Epizoa* or *Ichthyophthiria*; (3) *Entomostraca*, with such orders as *Copepoda*, *Ostracoda*, *Cladocera*, *Phyllopoda*, *Xiphura*, *Trilobita*, *Eurypterida*; (4) *Edriophthalma*, with *Læmodipoda*, *Amphipoda*, and *Isopoda*; (5) *Podophthalma*, with *Stomatopoda* and *Decapoda*; to which some add (6) *Podosomata*, often considered to be arachnidans. The fourth and fifth of these are often united as one subclass, *Malacostraca*. The trilobites with the eurypterygians and king-crabs sometimes constitute one prime division called *Gigantostraca*. Haeckel uses *Carides* as a substitute for *Crustacea*.

[*cap.*] The Southern Cross, the most celebrated constellation of the southern heavens. It was erected into a constellation by Royer in 1679, but was often spoken of as a cross before; there even seems to be an obscure allusion to it in Dante. It is situated south of the western part of Centaurus, east of the keel of Argus. It is a small constellation of four chief stars, arranged in the form of a cross. Its brightest star, the southernmost, is of about the first magnitude; the eastern, half a magnitude fainter; the northern, of about the second magnitude; and the western, of the third magnitude and faint. The constellation owes its striking effect to its compression, for it subtends only about 6° from north to south and still less from east to west. It looks more like a kite than a cross. All four stars are white except the northernmost, which is of a clear orange-color. It contains a fifth star of the fourth magnitude, which is very red.

The internal structure is exhibited in the cleavage, in the behavior of sections in polarized light, etc. The external form is discussed under *crystallography* (which see). Crystals are obtained in the laboratory either by fusing substances by heat and allowing them gradually to cool, or by dissolving them in a fluid and then abstracting the latter by slow evaporation; also by the direct condensation of a vapor produced by sublimation, as in the case of arsenious oxid, in the same way that snow-crystals are formed directly from water-vapor in the upper atmosphere. The name was first applied to the transparent varieties of quartz, specifically called *rock-crystal*.

There was a sea of glass like unto *crystal*. Rev. iv. 6.

The term *crystal* is now applied to all symmetrical solid shapes assumed spontaneously by lifeless matter.

If the process is slow and undisturbed, the molecules assume a regular arrangement, each substance taking a determinate form according to its natural laws; but if the process is rapid or disturbed, the external form may be more or less irregular. An amorphous solid body may also undergo partial crystallization by a molecular rearrangement, giving it a more or less complete crystalline structure, as, for instance, in the iron of a railroad-bridge after long use. See *crystallography*.

2. The mass or body formed by the process of crystallizing.

Also spelled *crystallisation*.

Alternate crystallization, a species of crystallization which takes place when several crystallizable substances having little affinity for one another are present in the same solution. The substance which is largest in quantity and least soluble crystallizes first, in part; the least soluble substance next in quantity then begins to crystallize; and thus different substances, as salts, are often deposited in successive layers from the same solution.—**Water of crystallization**, water which is held by certain salts as a part of their crystalline structure, but is not inherent in the molecule. Thus, common sodium carbonate, when it crystallizes from a solution, contains for each molecule of sodium carbonate ten molecules of water. This is so weakly held that it escapes as vapor in dry air at ordinary temperatures. The crystalline form of the salt often depends on the number of molecules of water which the crystals contain. Water of crystallization differs from combined water in that it does not belong to the molecular structure, but only to the crystalline structure, of the substance.

The following are the generally adopted systems of crystallization, based upon the degree of symmetry which characterizes the different forms, but defined according to the length and inclination of the assumed axes: (*a*) the *isometric*, characterized by three rectangular axes, all of equal length; (*b*) the *tetragonal*, by three rectangular axes, two of which are of equal length; (*c*) the *hexagonal* (and *rhombohedral*), by four axes, three of equal length, in the same plane, and inclined to one another at an angle of 60°, the fourth of different length, and at right angles to the plane of the other three; (*d*) the *orthorhombic*, by three rectangular axes of unequal length; (*e*) the *monoclinic*, by three axes, two at right angles to each other, and the third perpendicular to one and oblique to the other; and (*f*) the *triclinic*, by three axes, all oblique to one another. Instead of *isometric*, the terms *monometric*, *cubic*, and *regular* are sometimes used; instead of *tetragonal*, *dimetric*; instead of *orthorhombic*, *trimetric* or *rhombic*; instead of *monoclinic*, *monosymmetric* or *oblique*; and instead of *triclinic*, *asymmetric* or *anorthic*. The isometric, tetragonal, and orthorhombic systems are sometimes spoken of collectively as *orthometric*, and the monoclinic and triclinic as *clinometric*; similarly, the tetragonal and hexagonal systems have been called *isodiametric*. (*b*) The inner bone of the forearm; the ulna.— **2.** A linear unit derived from the length of the forearm. The natural cubit used for measuring cloth was probably originally the length from the end of the thumb-nail to the elbow, though no cubit so short is known. The royal Egyptian cubit is, of all units of measure or weight, that one whose use can be traced back in history the furthest; for it was employed in the construction of the pyramids of Gizeh, perhaps 3500 B. C. From a number of Egyptian measuring-sticks found in the tombs, this cubit is ascertained to be equal to 20.64 English inches, or 524 millimeters. It was divided into seven palms, instead of six as the ordinary cubit was; and this was probably owing to measurements along walls with the forearm having been made by placing the hand behind the elbow and leaving it on the wall until the arm was laid down again. The Egyptian and Roman are the only ancient cubits of importance whose lengths are undisputed. The Roman cubit was 1½ Roman feet, or 17.4 English inches. Two cubits are mentioned in the Bible, for Ezekiel speaks of a cubit which is a cubit and a hand-breadth. The shorter of these cubits was probably that which in Deuteronomy is called the cubit of a man; the longer one, that which in Chronicles is called the cubit after the first measure—that is, the most ancient cubit. Julian of Ascalon speaks of two cubits in the ratio of 28 to 25. But we have no accurate knowledge of the lengths of the Hebrew cubits, since the cubit of the temple is estimated variously by high authorities, as from 19 to 26 inches. There are many cubits, ancient and modern, of widely different values.

And gee schulle undirstonde, that the Cros of oure Lord was eyght *Cubytes* long, and the overthwart piece was of lengthe thre *Cubytes* and an half. *Mandeville*, Travels, p. 12.

When the complete brassart was introduced, toward the close of the fourteenth century, the cubitière formed a part of this, and was regularly articulated; but the old cup-shaped form or some modification of it was retained by those who could not afford the expense of the brassart of plate. A similar imitation occurs also in *coo, cook*[2], *cock*[1], *caw,* etc. (see these words). The forms, being imitative, do not conform closely to the rules of historical development. In early superstitions the cuckoo was regarded as of evil omen, and enters into various imprecations and proverbs as an embodiment of the devil. It was also a term of reproach or contempt equivalent to *fool* (cf. *gowk,* in similar use), and with reference to its habit of laying its eggs in other birds' nests is the subject of endless allusion in early literature: see *cuckold*[1].] 1. bill, and ashy plumage varied with black and white. It is notorious for its parasitism, having the habit common to many birds of the family of depositing its eggs in the nests of other birds, chiefly smaller than itself, and causing its young to be reared by the foster-parents—a condition generally entailing the destruction of their own progeny. The remarkable cries which have given the bird imitative names in many languages are the love-notes, uttered only during the mating season. The species of cuckoos are very numerous, and are found in most parts of the world; they are not all parasitic. There are several subfamilies of *Cuculidæ,* and many genera. (See *Cuculidæ.*) The American or tree-cuckoos are arboricole, not parasitic, and are confined to America; they are also called hook-billed cuckoos, a term not of special pertinence. The ground-cuckoos are American birds of terrestrial habits. The crested cuckoos are old-world forms, as are also the coucals, lark-heeled or spur-heeled cuckoos, also called pheasant-cuckoos.

2. (*a*) A distinct terminal part of a sleeve at the wrist, intended for embellishment. In the fifteenth century a prominent part of the dress was the large cuff, which could be turned down so as to cover the hand to the finger-tips, and when turned back reached nearly to the elbow. In modern times the coat-sleeve has been sometimes made with a cuff which can be turned down over the hand, though not intended to be so used, and sometimes with a semblance of a cuff, indicated by braid and buttons, or by a facing of velvet or other material, or merely by a line or lines of stitching around the sleeve. (*b*) A band of linen, lace, or the like, taking the place of, and covering a part of the sleeve in the same manner as, the turned-up cuff. In the seventeenth century such cuffs, worn by ladies, were often extremely rich, of expensive lace, and reached nearly to the elbow. Plain linen cuffs were also worn about 1640, and were especially affected by the Puritans in England. When the plain linen wristband worn attached to the shirt by men first came into use, in the early part of the nineteenth century, it was commonly turned back over the sleeve, and was a true cuff. The cuirass seems to have been first adopted in England in the reign of Charles I., when the light cavalry were armed with buff coats, having the breast and back covered with steel plates. Subsequently this piece of armor fell into disuse, and was resumed by the English only after the battle of Waterloo, where the charges of the French cuirassiers were very effective.

Gelatin culture, a growth of bacteria in a medium made of the consistence of jelly by means of gelatin.—**Pure culture**, in *bacteriology*, a growth of one kind of bacteria free from admixture of other varieties.—**Solid culture**, a culture of bacteria, etc., for which the medium is a solid at ordinary temperatures, usually gelatin or a preparation, such as agar-agar, made from algæ.—**Test-tube culture**, a growth of bacteria in a test-tube.=**Syn. 4–6.** *Refinement*, *Cultivation*, *Culture*. Each of these words may represent a process or the result of that process. Only *refinement* can, when unqualified, represent a process or result carried too far. *Refinement* is properly most negative, representing a freeing from what is gross, coarse, rude, and the like, or a bringing of one out of a similar condition in which he is supposed to have been at the start. *Cultivation* and *culture* represent the person or the better part of him as made to grow by long-continued and thorough work. *Refinement* and *cultivation*, as thus representing the more negative and the more positive aspects of the improvement of man, were much more common until within thirty years; since then *culture* has largely supplanted *cultivation*: this change, coming when great attention was concentrating about the subject of the development of all the departments of the nature of man, produced a great enlargement of the definition of *culture*, for a time the improvement and gratification of taste being magnified in undue proportion by some, and by others the mere acquisition of knowledge. The word is now applied to the improvement of the whole man, bodily, mentally, and spiritually, although bodily training is not prominent unless specially mentioned; the moral and the spiritual are jealously included. *Culture* may be used of the state of society as well as of the man; *refinement* and *cultivation* refer primarily to the state of the individual. As referring to either, *culture* in its broadest sense may be called the highest phase of civilization.

What do we mean by this fine word *Culture*, so much in vogue at present? What the Greeks naturally expressed by their παιδεία, the Romans by humanitas, we less happily try to express by the more artificial word *Culture*. . . . When applied to the human being, it means, I suppose, the "educing or drawing forth [of] all that is potentially in a man," the training [of] all the energies and capacities of his being to the highest pitch, and directing them to their true ends. *Shairp*, Culture and Religion, i.

=Syn. 4. *Cunning, Artful, Sly, Subtle, Shrewd, Tricky, Adroit, Wily, Crafty, Intriguing*, sharp, foxy. All these words suggest something underhand or deceptive. *Cunning*, literally knowing, and especially knowing how, now implies a disposition to compass one's ends by concealment; hence we speak of a fox-like *cunning*. *Artful* indicates greater ingenuity and ability, the latter, however, being of a low kind. *Sly* is the same as *cunning*, except that it is more vulgar and implies less ability. ("A col-fox, ful of *sleigh* iniquité." *Chaucer*, Nun's Priest's Tale, l. 395.) ("Envy works in a *sly*, imperceptible manner." *Watts.*) *Subtle* implies concealment, like *cunning*, but also a marked ability and the power to work out one's plans without being suspected; hence, while *cunning* is applicable to brutes, *subtle* is too high a word for that, except by figurative use. The rabbit is *cunning* enough to hide from the dog; Mephistopheles is *subtle*. (For the favorable meanings of *subtle*, see *astute*. For the good senses of *shrewd*, see *acute*.) In its unfavorable aspects *shrewd* implies a penetration and judgment that are somewhat narrow and worldly-wise, too much so to deserve the name of sagacity or wisdom. (See *astute*.) *Tricky* is especially a word of action; it expresses the character and conduct of one who gets the confidence of others only to abuse it by acts of selfishness, especially cheating. *Adroit*, in a bad sense, expresses a ready and skilful use of trickery, or facility in performing and escaping detection of reprehensible acts. (See *adroit*.) *Wily* is appropriate where a person is viewed as an opponent in real or figurative warfare, against whom wiles or stratagems are employed: a *wily* adversary is one who is full of such devices; a *wily* politician is one who is notably given to advancing party interests by leading the opposite side to commit blunders, etc. A *crafty* man has less ability than a *subtle* man, and works more by deception or knavery than the *shrewd* man; he is more active than the *cunning* man, and more steadily active than the *sly* man; he is on the moral level of the *trickish* man. *Intriguing* is applied where the plots are secret arrangements made with others, perhaps against a third party, and especially of a complicated character.

He is generally represented as a beautiful boy with wings, carrying a bow and quiver of arrows, and is often spoken of as blind or blindfolded. The name is often given in art to figures of children, with or without wings, introduced, sometimes in considerable number, as a motive of decoration, and with little or no mythological allusion.

Controller of the Currency. See *controller*, 2.—**Decimal currency**, a system of money the divisions or denominations of which proceed from its lowest unit of reckoning by ten or its multiples, or aliquot parts thereof, as the cent, dime, dollar, quarter-dollar, etc., of the United States and Canada.—**Fractional currency**, coins or paper money of a smaller denomination than the monetary unit; in the United States, half-dollars, quarters, dimes, and 5-cent, 3-cent, 2-cent, and 1-cent pieces. Fractional currency in paper has been largely used in several European countries, and is a part of the monetary system of Japan. Fractional notes have been used at different times in the United States, especially during the financial panic of 1837–38, and during and after the civil war of 1861–65, when specie was withdrawn from circulation. The former received the name of *shinplasters*. (See *shinplaster*.) On March 17th, 1862, Congress authorized an issue of circulating notes called *postage currency*, imitating in style the stamps that had previously been used at great inconvenience, in denominations of 5, 10, 25, and 50 cents. These were superseded by the fractional currency authorized March 3d, 1863, in denominations of 3, 5, 15, 25, and 50 cents. The issue of fractional notes was suspended by act of April 17th, 1876; but its renewal has since been proposed for convenience in remittance of small sums.—**Metallic currency**, the gold, silver, and copper in circulation as money.—**National Currency Acts**, statutes of the United States of 1863, 1864, and 1865, providing for a general and uniform bank-note currency guaranteed by the United States and secured by national bonds deposited in the Treasury.—**Paper currency**, notes issued by a government or by banks as a substitute for money, or as a representative of money. The paper currency of the United States is of three kinds: (1) notes issued by the government and called *demand treasury notes*, or more generally *legal-tenders*; (2) notes issued by national banks; and (3) certificates issued by the government upon either gold or silver. The smallest denomination of the first is $20, and of the last $1.—**Postage currency**, See *fractional currency*, above.—**The currency principle**, a phrase first employed in English banking to express the mode of issuing notes by the Bank of England. An amount fixed by law is issued, based on an equal amount of securities, mostly government obligations; and all notes issued in excess of that amount, which is called "the fixed ★issue," are based on an equal amount of specie.

Ne'er keeps retiring ebb. *Shak.*, Othello, iii. 3.

2. Specifically, a portion of a large body of water or of air moving in a certain direction: as, ocean-*currents*. The *set of a current* is that point of the compass toward which the waters run; the *drift of a current* is the rate at which it runs. Ocean currents are often divided into *drifts* and *streams*: the former are broad, shallow, and slow-moving; the latter are narrow, deep, and fast-moving (up to 80 miles or more a day), and gain their unusual velocity and depth from constriction in a strait, as in the Strait of Florida, where the Gulf Stream well deserves its name; or from constriction between the winds and the land, as south of Japan, where the Kuroshiwo resembles the Gulf Stream. Much of the North Atlantic current that is popularly known as the Gulf Stream is properly a drift. In the larger ocean areas, such as North Atlantic, Indian, etc., the currents unite or circulate in such a way as to form a vast eddy, turning clockwise in the North Atlantic and North Pacific, but counter-clockwise in the South Atlantic, South Pacific, and Indian oceans. A *counter-current* is a smaller ocean current running against the course of a neighboring current: applied especially to the narrow westward currents between the eastward equatorial currents. See *ocean*.

The earth-current is due to this difference, which is generally temporary and often large. If the earth-plates of a circuit are of different metals, as copper and zinc, an *earth-battery current* is set up which is feeble and tolerably constant.—**Electric current**, the passage of electricity through a conductor, as from one pole of a voltaic battery to the other—for example, in the telegraph. (See *electricity*.) A current is said to be *intermittent* when repeatedly interrupted, as by the breaking and making of the circuit, *pulsatory* when characterized by sudden changes of intensity, and *undulatory* when the intensity varies according to the same law as that governing the velocity of the air-particles in a sound-wave.—**Faradaic current.** See *faradaic*.—**Galvanic current**, an electric current generated by a galvanic battery, as distinguished from an induced current, or a current produced by a dynamo or other electrical machine.—**Induced current.** See *induction*.—**Interrupted current**, an electric current the flow of which is completely arrested at frequently recurring intervals. It is generally produced by means of a rapidly vibrating armature, a rotating disk, or a similar device. —**Inverse current**, the current induced in the secondary coil of an induction apparatus when the circuit of the primary is closed. It is contrary to the primary current in direction.—**Muscle-current**, the electrical current which passes on connecting different points of a muscle.—**Polyphase current**, a system combining two or more alternating currents differing in phase.—**Primary current**, the electric current which passes through the primary coil of an induction apparatus, in the secondary

coil of which the secondary or induced current is produced. —**Reverse current**†, an electric current opposite in direction to the normal current. =**Syn. 1** and **2**. *Eddy*, etc. See *stream*.

cursive (kėr'siv), *a.* and *n.* [= F. *cursif* = Sp. Pg. *cursivo* = It. *corsivo*, < ML. *cursivus*, running (of writing), < L. *cursus*, a running, a course, < *currere*, run: see *current*[1].] I. *a.* Running; flowing, as writing or manuscript in which the letters are joined one to another, and are formed rapidly without raising the pen, pencil, or stylus; specifically, in *paleography*, modified from the capital or uncial form, so as to assume a form analogous to that used in modern running hand: as, the *cursive* style; *cursive* letters; *cursive* manuscripts. Greek cursive writing is found in papyri dating back to about 160 B.C., at first very similar to the lapidary and uncial characters of the same period, but gradually becoming more rounded in form and negligent in style. The epithet *cursive* is, however, most frequently applied to the later cursive or minuscule writing from the ninth century on. (See *minuscule.*) The beginning of a Latin cursive character is seen in some waxed tablets discovered in 1875 in the house of L. Cæcilius Jucundus at Pompeii. Forms similar to these also occur in the dipinti and graffiti (characters painted on or incised in walls, earthenware, etc.) of the same place or period. The ancient Latin cursive character known to us in manuscripts from the fourth century on is, however, considerably different from this. In medieval manuscripts the cursive hand was employed from the Merovingian epoch, often in combination with the other contemporary styles; but from the ninth century it was replaced for all careful work by the so-called Caroline and Gothic characters, and continued in use up to the invention of printing only in degenerated form and for writings of small importance or hasty execution. (See *manuscript.*)

In the earliest examples of *cursive* writing we find the uncial character in use, and, as has been already remarked, many of the specimens fluctuate between the more formal or set book-hand and the *cursive.*
Encyc. Brit., XVIII. 149.

II. *n.* 1. A cursive letter or character: as, a manuscript written in *cursives.*

(*b*) Plane curvature existing in any part of a twisted curve; that kind of curvature which exists at any part of a surface where the osculating quadric surface reduces to a sphere.—**Synclastic curvature,** that kind of curvature which belongs to a surface not cutting its tangent-plane in a real locus. —**Whole, total,** or **integral curvature,** the angle between the normals at the extremities of an arc of a plane curve; as applied to a portion of a surface, the area on the surface of a unit-sphere described by a radius which moves parallel to the normal to the contour of the portion of surface whose curvature is spoken of; as applied to an arc of a twisted curve, the length of the curve described on the surface of a unit-sphere by a radius moving parallel to the normal to the curve.

★**curve** (kėrv), *a.* and *n.* [In earlier use *curb*, < ME. *courbe*, < OF. *courbe, corbe* (see *curb*), F. *courbe* = Pr. *corb* = Sp. Pg. It. *curvo*, < L. *curvus*, bent, curved, = OBulg. *krivŭ*, bent, = Lith. *kreivas*, crooked, akin to Gr. *κυρτός*, bent, and prob. to *κρίκος, κίρκος*, L. *circus*, a ring, circle: see *circle.*] **I.** *a.* Bending; crooked; curved.

A *curve* line is that which is neither a straight line nor composed of straight lines. *Ogilvie.*

II. *n.* **1.** A continuous bending; a flexure without angles; usually, as a concrete noun, a one-way geometrical locus which may be conceived as described by a point moving along a line round which as axis turns a plane, while the line rotates in the plane round the point. The curve is at the same time the envelop of the plane and of the line. Geometers understand a curve as something capable of being defined by an equation or equations, or otherwise described in general terms. It may thus have nodes, cusps, and other singularities, but must not be broken in a way which cannot be precisely defined without the use of special numbers. Curves are often employed in physics and statistics to represent graphically the changes in value of certain physical or statistical quantities: as, the energy *curve* of the solar spectrum; the isothermal line or *curve;* the *curve* of population.

Nor pastoral rivulet that swerves

An *in curve* is one that deflects from the straight line toward the batter; an *out curve,* away from the batter. A *drop* deflects downward, and a *rise* or *up curve* upward.—**Adiabatic curve.** See *adiabatic.*—**Algebraic curve,** a curve whose equations in linear coördinates contain only algebraic functions of the coördinates.—**Anaclastic curves, anallagmatic curves.** See the adjectives.—**Anticlinal** and **synclinal curves,** in *geol.*, terms applied to the elevations and depressions of undulating surfaces of strata. 2. In *law*, collectively, the settled habitudes of a community, such as are and have been for an indefinite time past generally recognized in it as the standards of what is just and right; ancient and general usage having the force of law. Some writers use the word without qualification, as meaning only *general customs*—that is, such as are prevalent throughout the nation; and some as meaning only *local* or *particular customs*, such as obtain only in a particular class, vocation, or place. In modern use, *custom* is more appropriate to immemorial habitudes, either general or characteristic of a particular district and having legal force, and *usage* to the habitudes of a particular vocation or trade. In the history of France the term *custom* is applied specifically to numerous systems of ancient usage which were judicially recognized as binding upon their respective communities before the revolution of 1789, or until the promulgation of the Code Napoléon: as, the *custom* of Normandy, of Brittany, of Orleans, etc. There were 60 general customs (each extending over a whole province) and 165 particular customs (those of cities, bishoprics, etc.) reduced to writing. The custom of Paris was established by the French as the law of Canada, and many of its provisions were embodied in the Code Napoléon.

4. Toll, tax, or duty; in the plural, specifically, the duties imposed by law on merchandise imported or exported. cuttlebone (kut'l-bōn), *n.* The internal plate of *Sepia officinalis*, consisting of a friable calcareous substance, formerly much used in medicine as an absorbent, but now chiefly for polishing wood, paint, varnish, etc., and for pounce and tooth-powder. A cuttlebone is often hung in the cage of canaries, its slightly saline taste being relished by the birds and acting as a gentle stimulus to their appetite, and its substance affording lime for the shells of their eggs. Also called *sepiost*. See cut under *Dibranchiata*.

cuttlefish (kut'l-fish), *n.* [< *cuttle*[1] + *fish*[1]; cf. D. *kuttelvisch* (Kilian; now *inktvisch*, inkfish), G. *kuttelfisch*, both prob. of E. origin.] A cephalopod; specifically, a cephalopod of the genus *Sepia* and family *Sepiidæ;* a dibranchiate cephalopodous mollusk, with a depressed body, inclosed in a sac. The shorter arms or feet, eight in number, covered with four rows of raised disks or suckers, are arranged around the mouth, and from the midst of them extend two long tentacles, also furnished with disks. These members the animal uses in walking, for attaching itself to objects, and for seizing its prey. A tube or funnel exists below the head and leads from the gills, through which the water admitted to these organs is expelled; and the creature, by ejecting the water with force, can dart backward with amazing velocity. In a sac on the back of the mantle there is a light, porous, calcareous shell formed of thin plates; this is the cuttlebone or sepiost, corresponding to the calamary or pen of the squids. (See *calamary*.) The cuttlefish has the power of ejecting a black, ink-like fluid, the sepia of artists (see *sepia*), from a bag or sac, so as to darken the water and conceal itself from pursuit. From this usage the term *cuttlefish* is extended not only to all the forms of *Sepiidæ* and related decapod cephalopods, but also to the octopod members of the same class. When the octopods are called cuttlefishes, the decapods are commonly distinguished as *squids*. The two figures illustrate the two principal types. See *Decapoda, Octopoda*, and *Cephalopoda*, and cuts under *Dibranchiata, ink-bag*, and *Sepia*.

Under a pressure of between three and four atmospheres it becomes a limpid liquid; and it is highly poisonous and irrespirable. It is obtained by heating dry mercury cyanide. It unites with oxygen, hydrogen, and most other non-metallic elements, and also with the metals, forming cyanides. In combination with iron it forms pigments of a dark-blue color, variously called Prussian blue, Chinese blue, Berlin blue, and Turnbull's blue. Also *cyan*.

The hue of the object is measured by its correspondence with one of these shades.

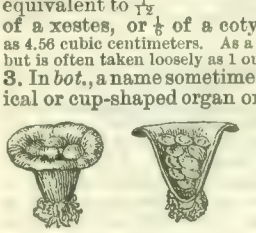

Fig. 1. The blastoderm divided into five segments, *I*, *II*, *III*, *IV*, *V*, of which the cyathozoöid, *I*, is the largest; 2, 3, 4, 5, constrictions separating the other ascidiozoöids. Fig. 2. Fetus with the ascidiozoöids *II*, *V* half encircling the base of the cyathozoöid, *I*; *B*, mouth of the cyathozoöid. Fig. 3. Fetus more advanced, the remains of the cyathozoöid, *I*, and ovisac hidden by the circle of ascidiozoöids *II*, *III*, *IV*. The result [of the process of yelk-division] is the formation of an elongated flattened blastoderm, which occupies one pole of the egg, and is converted into what I termed the *cyathozoöid*, which is . . . a sort of rudimentary ascidian. From this, a prolongation or stolon is given off, which becomes divided by lateral constrictions into four portions, each of which gives rise to a complete ascidiozoöid. As these increase in size, they coil themselves round the *cyathozoöid*, with their oral openings outwards and their cloacal openings inwards, and thus lay the foundation of a new ascidiarium. The *cyathozoöid* eventually disappears, and its place is occupied by the central cloacal cavity. *Huxley*, Anat. Invert., p. 528.

Cycadaceæ (sik-ạ-dā′sē-ē), *n. pl.* [< *Cycas* (*Cycad-*) + *-aceæ*.] A very peculiar family of gymnospermous plants, in many particulars having affinities with the ferns, though some of the genera resemble palms in their general appearance. They are long-lived and of slow growth. The stem is rarely branched, is elongated by a terminal bud, and bears a crown of large pinnate leaves, which are circinate in vernation. The flowers are dicœcious, the male flowers in terminal cones formed of scales bearing numerous one-celled anthers on the dorsal surface. The seeds are borne on the margins of altered leaves in the genus *Cycas*, and on the inner surface of the peltate scales of a cone in the other genera. It has recently been dis-

covered that in the genera *Cycas* and *Zamia* the immediate act of fecundation is brought about by motile spermatozoids, as is the case in the *Pteridophyta* and other lower plants, although the first development from the pollen germ is a pollen-tube, as in the case of the phanerogamic plants. The relationship to the *Pteridophyta* on the one side and to the phanerogams on the other is thus clearly shown. The spermatozoids are very large and those of *Zamia* are the largest known in any plant or animal. The wood is without resin, and the pith large. The plants of this family inhabit India, Australia, the Cape of Good Hope, and tropical America. There are about 80 species, in 9 genera, of which the chief are *Cycas*, *Zamia*, *Macrozamia*, *Encephalartos*, and *Dion*. The farinaceous pith of various species is used for food, and they are frequently cultivated in hothouses for ornament or because of their curious habit. The *Cycadaceæ* are found in the various geological formations, beginning with the Permian. They are exceedingly abundant in the Mesozoic, and especially in the earlier stages of that series. On this account the Mesozoic formations are sometimes classed together as representing the "age of cycads." See *Pterophyllum*, *Zamites*, *Otozamites*, *Pterozamites*.

They have simple stems, bearing a crown of pinnate leaves with narrow leaflets. The pollen is contained in valvate anthers on the under surface of scales, which are united into large cones, but immediate fecundation is by motile spermatozoids. (See *Cycadaceæ*.) The seeds of several species are made into flour for bread, and the pith of the trunk yields a coarse sago, whence the com-

In the former case a circle represented by the head of the bone turns through nearly 180° upon its own center, a segment of its circumference gliding in the lesser sigmoid cavity of the ulna. In the atloaxoid cyclarthrosis a ring swings back and forth upon a pivot at one point inside the circumference. Also called *rotatory diarthrosis* and *lateral ginglymus*.

Carnot's cycle, the succession of operations undergone by the substance in the interior of Carnot's ideal engine: namely, the piston is first forced down without the escape of any heat by conduction; next, heat is communicated to the contents of the cylinder, and by its expansion at constant temperature drives the piston out; third, addi-

tion of heat is stopped, but the energy in the substance does work on the piston, increasing the volume of the substance but lowering its pressure and temperature; finally, heat is removed from the contents of the cylinder, but pressure is put on to the piston so as to preserve the temperature unchanged until the body in the cylinder is brought back to its original condition; or all these operations are reversed.—**Chinese cycle.** See *sexagenary cycle.*—**Cycle of indiction,** an arbitrary period of 15 years used in Roman and ecclesiastical history. The year A. D. 313 is taken as the first year of the first cycle. —**Cycle of the saros,** or **Chaldean cycle,** a period of very nearly 6,585⅓ days, in which eclipses recur nearly in the same way.—**Hebdomadal** or **heptal cycle,** a period of seven days or years, which was supposed, either in its multiple or submultiple, to govern many phenomena of animal life. *Dunglison.*—**Metonic cycle,** the lunar-solar cycle, established by the Greek astronomer Meton, the first year of the first cycle beginning 432 B. C., June 27. It contained 19 years, of which 12 consisted of 12 lunations, and the other 7—that is to say, the 3d, 6th, 8th, 11th, 14th, 16th, and 19th—consisted of 13 lunations. At the end of the cycle the sun was in about the same position as at the beginning; in fact, 19 tropical years are 6,939.60 days, while 235 lunations are 6,939.69 days, so that there is a difference of only about 2 hours between the two. This cycle is used in ecclesiastical computations in determining the date of Easter. See *golden number,* under *golden.* —**Paschal cycle,** a period of 532 years, after which Easter falls on the same day of the year.—**Sexagenary cycle,** a cycle of 60 (years, days, hours, etc.) in use throughout the Chinese empire and the countries receiving their literature and civilization from China. It is said to have been contrived by the Emperor Hwang-ti, 2637 B. C. In the northern hemisphere the cyclonic motion is always counter-clockwise, and in the southern hemisphere it is clockwise. Cyclones generally develop into cyclonic storms. See *anticyclone*.

Cyclones occur at all hours of the day and night, whereas whirlwinds and tornadoes show a diurnal period as distinctly marked as any in meteorology. Finally, *cyclones* take place under conditions which involve unequal atmospheric pressures or densities at the same heights of the atmosphere, due to inequalities in the geographical distribution of temperature and humidity; but whirlwinds occur where for the time the air is unusually warm or moist, and where, consequently, temperature and humidity diminish with height at an abnormally rapid rate. *Cyclones* are thus phenomena resulting from a disturbance of the equilibrium of the atmosphere considered horizontally, but whirlwinds and tornadoes have their origin in a vertical disturbance of atmospheric equilibrium.
Encyc. Brit., XVI. 129.

The older and poorer forms embody the idea that at any point the direction toward the storm-center makes an angle of 90° with the direction of the wind, in agreement with the circular theory; but in the newer forms, especially Faura's barocyclonoscope for the Philippine region, this angle differs from 90° in accordance with observations in that locality.

[Commonly with a capital when used with direct reference to these beings: as, *Cyclopean* architecture. See below.] Specifically—(*a*) Having a single eye in the middle of the forehead; in *zoöl.*, having a median and apparently or actually single eye. This state may be normal and permanent, as in some of the crustaceans; or normal and marking a stage of development; or monstrous, from defect of growth in the parts concerned, whereby the eyes are not separated. It occurs, for example, occasionally in the pig. (*b*) Single and situated in the middle of the forehead, as an eye.

A true, mean, *cyclopean* eye would be slightly to the right of the median line. *Mind*, IX. 93.

(*c*) Vast; gigantic: applied to an early style of masonry, sometimes imitated in later ages, constructed of stones either unhewn or more or less irregularly shaped and fitted together, usually polygonal, but in some more recent examples approaching regular horizontal courses, and often presenting joints of very perfect workmanship. Such masonry was fabled to be the work of the Cyclopes. It is remarkable for the immense size of the stones commonly employed, and was most frequently used for the walls of cities and fortresses. The walls of Tiryns, near Nauplia, in Greece, mentioned by Homer, are a good specimen of Cyclopean masonry. The remains of these walls consist of three courses, of which the stones, measuring from 6 to 9 feet long, from 3 to 4 feet wide, and from 2 to 3 feet deep, are rudely shaped, irregular masses piled on one another. Examples of Cyclopean work occur in Greece, Italy, Asia Minor, and elsewhere. The more primitive Cyclopean masonry in Greece, roughly built of stones entirely unhewn, the spaces between the larger stones being filled with smaller ones, is often termed *Pelasgic*.

In early life . . . they have a small, spiral, horny shell; but this becomes lost, and in its place the animal secretes a cartilaginous slipper-shaped shell, apparently possessing no more consistency than ordinary gelatine jelly. In this thick, transparent, flexible shell sits the mollusc, like the old woman in her shoe, paddling about by the large oval wings. *Stand. Nat. Hist.*, I. 358.

They were accordingly characterized by an ostentatious contempt of riches, arts, science, and amusements. The most famous Cynic was Diogenes of Sinope, a pupil of Antisthenes, who carried the doctrines of the school to an extreme and ridiculous asceticism, and is improbably said to have slept in a tub which he carried about with him.

By means of their ovipositors they puncture plants, depositing their eggs along, it is believed, with some irritant fluid which produces tumors commonly called galls or nut-galls. Besides the true gall-flies, the *Cynipidæ* include certain inquilinous and parasitic forms. The anterior wings lack a complete costal nervure and stigma (except in *Ibalia*); the abdomen is generally compressed-ovate or ovate, rarely cultriform; and the ovipositor is subspiral. Nearly 400 European cynipids have been described, and about 200 from North America, many of which latter are known only by their galls. The family is divided into five subfamilies, *Cynipinæ*, *Ibaliinæ*, *Inquilinæ*, *Allotriinæ*, and *Figitinæ*. It was called by Leach *Diplolepidæ*. The name of the family is also written *Cynipides*, *Cynipites*, *Cyniphidæ*, and *Cynipseæ*. The terms *Cynipsera* of Latreille and *Cynipsidæ* or *Cynipsides* of Leach are synonyms of *Chalcididæ*, not of the present family. See *gall*[3].

It formerly included all those baboons to which the term "dog-faced" was applied, from the extremely prognathous jaws, giving a canine physiognomy; but it is now restricted to exclude the drill, mandrill, etc. The common baboon is *C. babuin*, inhabiting northerly parts of Africa, where it lives in troops in rocky places. In this species the tail is about one third the whole length. Closely related are the chacma, *C. porcarius*, of South Africa, and the sphinx baboon, *C. sphinx*, of West Africa. The hebe or hamadryad, *C. hamadryas*, of Abyssinia, differs in having long hair on the head and shoulders, and a shorter tail, only about one fourth of the total length. *Cynocephalus* is nearly a synonym of *Papio*, of prior date.

There is but one family, the *Canidæ*, including the dogs, wolves, foxes, etc. See *Canidæ*.

The pelage is close and harsh; the nail of the thumb is well marked; the outer ears are rudimentary; the cheek-pouches are small; the skull is massive, short, and broad, with wide zygomatic arches and large postorbital processes; and the dentition is very strong and heavy. The genus contains the well-known prairie-dogs or barking squirrels of western North America, which live in extensive underground burrows, in colonies often of immense extent, in the sterile regions of the West. The common species are *C. ludovicianus*, the common prairie-dog, whose range in general is from the plains to the Rocky Mountains, and *C. columbianus*, extending thence westward. The characters of the family are chiefly comparative or negative, being those in which the general structure recedes from the man-like type presented by the higher simians. The gradation from the highest semnopithecoid to the lowest cynocephalus is a gentle one, though the difference between these extremes is great.

Cynopithecinæ (sī-nō-pith-ē-sī'nē), *n. pl.* [NL., < *Cynopithecus* + *-inæ*.] The lower one of the two subfamilies into which the *Cynopithecidæ* are divisible, including all kinds of cynopithecoid apes, monkeys, and baboons which have a simple stomach and cheek-pouches. The title *czar*, though historically equivalent, like its original *Cæsar*, to *emperor*, was not recognized as involving imperial rank at the time of its assumption by Ivan; and Peter the Great's assumption of such rank under the title of *imperator*, in addition to that of *czar*, was long contested by other powers.

aberglaube (ä′ber-glou″bę), *n.* [G. *aberglaube*, for **oberglaube*, *überglaube*, D. *overgeloof*, 'over-belief.' The first element simulates *aber*, but.] Belief beyond what is justified by experience and knowledge. See the extract.

> Our word 'superstition' had by its derivation this same meaning, but it has come to be used in a merely bad sense, and to mean a childish and craven religiosity. With the German word it is not so; therefore Goethe can say with propriety and truth: '*Aberglaube* is the poetry of life.' . . . Extra-belief, that which we hope, augur, imagine, is the poetry of life.

Aberration constant. See *constant of aberration*, under *constant*.—**Lateral aberration,** in the theory of lenses, the product of the spherical aberration and the relative aperture of the lens; the radius of the circle formed by rays passing through the edge of a lens and falling upon a screen placed at the focal point.—**Lateral spherical aberration.** Same as *circle of aberration*.—**Longitudinal aberration,** in the theory of lenses, the distance between the points in which rays passing through the central zone and the edges of the lens, respectively, cut the axis; spherical aberration.—**Negative spherical aberration,** in *optics*, spherical aberration in a divergent lens, where the focal length of the outer zones is greater than that of the center of the lens.—**Positive spherical aberration,** in *optics*, spherical aberration of a convergent lens, where the focal length of the outer zones is less than that of the center of the lens.
